

Cisco DNA Center software version 2.3.5 Key Features

Cisco DNA Center software version 2.3.5

How does it compare with previous versions?

Virtual Appliance

The new virtual appliance lets you deploy Cisco DNA Center in an entirely AWS cloud hosted solution in under 90 minutes!

Previously, you had to purchase a physical Cisco DNA Center appliance and install it in your Data Center, which was time-consuming. The install alone would take hours not counting planning and lead times. Now, you can host the virtual appliance immediately in AWS Cloud, only paying hosting costs.

Compliance

Compliance has been expanded included both network profiles and network settings. There are also now workflows to automatically remediate identified issues for network profiles, network settings and Application Visibility

Previously, compliance did not include checking the configuration of your network settings, or your templates. This meant templates or network settings were not monitored or enforced. Now the full intent of your configuration is monitored and can be remediated in the event of out-of-band changes.

API Enhancements

New APIs allow you to programmatically perform user management, network setting management, and enhanced wireless troubleshooting. You can now reconfigure and reboot APs via code.

Previously, APIs did not include network settings or credential changes. Also, they were limited in their ability to troubleshoot network issues. Now you have expanded support for monitoring, managing, and troubleshooting your entire network programmatically.

Template Hub

The new Template Hub makes it easy to view which network profiles are attached to your templates, as well as seeing how a template may conflict with existing configuration. In addition, the updated simulator allows you to test templates against a specific network device.

Previously, the template editor gave no visibility of which network profiles or sites a template was applied to. You had to go to network profiles and check them individually. Now, Template Hub has been completely redesigned and enhanced to give you not only full visibility of profiles & sites, but also enable you to assign them directly from the Template Hub!
