

Configuring FCoE VLANs and Virtual Interfaces

This chapter contains the following sections:

- [Information About Virtual Interfaces, page 1](#)
- [Guidelines for FCoE VLANs and Virtual Interfaces, page 1](#)
- [Configuring Virtual Interfaces, page 3](#)
- [Verifying the Virtual Interface , page 6](#)
- [Mapping VSANs to VLANs Example Configuration , page 7](#)
- [FCoE over Enhanced vPC, page 9](#)
- [SAN Boot with vPC, page 12](#)

Information About Virtual Interfaces

Cisco Nexus 5000 Series switches support Fibre Channel over Ethernet (FCoE), which allows Fibre Channel and Ethernet traffic to be carried on the same physical Ethernet connection between the switch and the servers.

The Fibre Channel portion of FCoE is configured as a virtual Fibre Channel interface. Logical Fibre Channel features (such as interface mode) can be configured on virtual Fibre Channel interfaces.

A virtual Fibre Channel interface must be bound to an interface before it can be used. The binding is to a physical Ethernet interface (when the converged network adapter (CNA) is directly connected to the Cisco Nexus 5000 Series switch), a MAC address (when the CNA is remotely connected over a Layer 2 bridge), or an EtherChannel when the CNA connects to the Fibre Channel Forwarder (FCF) over a virtual port channel (vPC).

Guidelines for FCoE VLANs and Virtual Interfaces

Follow these guidelines when configuring FCoE VLANs and Virtual Fiber Channel (vFC) Interfaces:

- Each vFC interface must be bound to an FCoE-enabled Ethernet or EtherChannel interface or to the MAC address of a remotely connected adapter. FCoE is supported on 10-Gigabit Ethernet interfaces.

The Ethernet or EtherChannel interface that you bind to the vFC interface must be configured as follows:

- The Ethernet or EtherChannel interface must be a trunk port (use the **switchport mode trunk** command).
- The FCoE VLAN that corresponds to a vFC's VSAN must be in the allowed VLAN list.
- You must not configure an FCoE VLAN as the native VLAN of the trunk port.

Note The native VLAN is the default VLAN on a trunk. Any untagged frames transit the trunk as native VLAN traffic.

- You should use an FCoE VLAN only for FCoE.
- Do not use the default VLAN, VLAN1, as an FCoE VLAN.
- You must configure the Ethernet interface as PortFast (use the **spanning-tree port type edge trunk** command).

Note You are not required to configure trunking on the server interface even if the switch interface is configured with trunking enabled. All non-FCoE traffic from the server will be passed on the native VLAN.

- The vFC interface can be bound to Ethernet port-channels with multiple member ports connected to FIP snooping bridges.
- Each vFC interface is associated with only one VSAN.
- You must map any VSAN with associated vFC interfaces to a dedicated FCOE-enabled VLAN.
- FCoE is not supported on private VLANs.
- If the converged access switches (in the same SAN fabric or in another) need to be connected to each other over Ethernet links for a LAN alternate path, then you must explicitly configure such links to exclude all FCoE VLANs from membership.
- You must use separate FCoE VLANs for FCoE in SAN-A and SAN-B fabrics.
- FCoE connectivity to pre-FIP CNAs over virtual port channels (vPCs) is not supported.

Note Virtual interfaces are created with the administrative state set to down. You must explicitly configure the administrative state to bring the virtual interface into operation.

Configuring Virtual Interfaces

Mapping a VSAN to a VLAN

A unique, dedicated VLAN must be configured at every converged access switch to carry traffic for each Virtual Fabric (VSAN) in the SAN (for example, VLAN 1002 for VSAN 1, VLAN 1003 for VSAN 2, and so on). If MST is enabled, a separate MST instance must be used for FCoE VLANs.

SUMMARY STEPS

1. switch# **configure terminal**
2. switch(config)# **vlan *vlan-id***
3. switch(config-vlan)# **fcoe [vsan *vsan-id*]**
4. switch(config-vlan)# **exit**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|--|---|
| Step 1 | switch# configure terminal | Enters configuration mode. |
| Step 2 | switch(config)# vlan <i>vlan-id</i> | Enters VLAN configuration mode. The VLAN number range is from 1 to 4096. |
| Step 3 | switch(config-vlan)# fcoe [vsan <i>vsan-id</i>] | Enables FCoE for the specified VLAN. If you do not specify a VSAN number, a mapping is created from this VLAN to the VSAN with the same number. Configures the mapping from this VLAN to the specified VSAN. |
| Step 4 | switch(config-vlan)# exit | Exits VLAN configuration mode. |

This example shows how to map VLAN 200 to VSAN 2:

```
switch(config)# vlan 200
switch(config-vlan)# fcoe vsan 2
```

Creating a Virtual Fibre Channel Interface

You can create a virtual Fibre Channel interface. You must bind the virtual Fibre Channel interface to a physical interface before it can be used.

SUMMARY STEPS

1. switch# **configure terminal**
2. switch(config)# **interface vfc vfc-id**
3. switch(config-if)# **bind {interface {ethernet slot/port | port-channel channel-number} | mac-address MAC-address}**
4. (Optional) switch(config-if)# **no bind {interface {ethernet slot/port | port-channel channel-number} | mac-address MAC-address}**
5. (Optional) switch(config)# **no interface vfc vfc-id**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|--|--|
| Step 1 | switch# configure terminal | Enters configuration mode. |
| Step 2 | switch(config)# interface vfc vfc-id | Creates a virtual Fibre Channel interface (if it does not already exist) and enters interface configuration mode. The virtual Fibre Channel interface ID range is from 1 to 8192. |
| Step 3 | switch(config-if)# bind {interface {ethernet slot/port port-channel channel-number} mac-address MAC-address} | Binds the virtual Fibre Channel interface to the specified interface. |
| Step 4 | switch(config-if)# no bind {interface {ethernet slot/port port-channel channel-number} mac-address MAC-address} | (Optional) Unbinds the virtual Fibre Channel interface from the specified interface. |
| Step 5 | switch(config)# no interface vfc vfc-id | (Optional) Deletes a virtual Fibre Channel interface. |

This example shows how to bind a virtual Fibre Channel interface to an Ethernet interface:

```
switch# configure terminal
switch(config)# interface vfc 4
switch(config-if)# bind interface ethernet 1/4
```

This example shows how to bind a virtual Fibre Channel interface to a Nexus 2232PP fabric extender Ethernet interface:

```
switch# configure terminal
switch(config)# interface vfc 1001
switch(config-if)# bind interface ethernet 100/1/1
```

This example shows how to bind a virtual Fibre Channel interface to create a vPC:

```
switch# configure terminal
switch(config)# interface vfc 3
switch(config-if)# bind interface port-channel 1
```

This example shows how to bind a virtual Fibre Channel interface on a Nexus 2232PP fabric extender to create a vPC:

```
switch# configure terminal
switch(config)# interface vfc 1001
switch(config-if)# bind interface ethernet 100/1/1
```

Note An error message is displayed if you attempt to bind the interface to a Nexus fabric extender that does not support FCoE.

This example shows how to bind a virtual Fibre Channel interface to a MAC address:

```
switch# configure terminal
switch(config)# interface vfc 2
switch(config-if)# bind mac-address 00:0a:00:00:00:36
```

This example shows how to bind a virtual Fibre Channel interface to a Nexus 2232PP fabric extender MAC address:

```
switch# configure terminal
switch(config)# interface vfc 1001
switch(config-if)# bind mac-address 00:01:0b:00:00:02
```

This example shows how to delete a virtual Fibre Channel interface:

```
switch# configure terminal
switch(config)# no interface vfc 4
```

Associating a Virtual Fibre Channel Interface to a VSAN

A unique, dedicated VLAN must be configured at every converged access switch to carry traffic for each Virtual Fabric (VSAN) in the SAN (for example, VLAN 1002 for VSAN 1, VLAN 1003 for VSAN 2, and so on). If MST is enabled, a separate MST instance must be used for FCoE VLANs.

SUMMARY STEPS

1. switch# **configure terminal**
2. switch(config)# **vsan database**
3. switch(config-vsantdb)# **vsan vsan-id interface vfc vfc-id**
4. (Optional) switch(config-vsantdb)# **no vsan vsan-id interface vfc vfc-id**

DETAILED STEPS

| | Command or Action | Purpose |
|--------|--|--|
| Step 1 | switch# configure terminal | Enters configuration mode. |
| Step 2 | switch(config)# vsan database | Enters VSAN configuration mode. |
| Step 3 | switch(config-vsantdb)# vsan vsan-id interface vfc vfc-id | Configures the association between the VSAN and virtual Fibre Channel interface. |

| | Command or Action | Purpose |
|---------------|--|---|
| | | The VSAN number must map to a VLAN on the physical Ethernet interface that is bound to the virtual Fibre Channel interface. |
| Step 4 | switch(config-vsan)# no vsan vsan-id interface vfc vfc-id | (Optional) Disassociates the connection between the VSAN and virtual Fibre Channel interface. |

This example shows how to associate a virtual Fibre Channel interface to a VSAN:

```
switch# configure terminal
switch(config)# vsan database
switch(config-vsan)# vsan 2 interface vfc 4
```

Verifying the Virtual Interface

To display configuration information about virtual interfaces, perform one of the following tasks:

| Command | Purpose |
|--|---|
| switch# show interface vfc vfc-id | Displays the detailed configuration of the specified Fibre Channel interface. |
| switch# show interface brief | Displays the status of all interfaces. |
| switch# show vlan fcoe | Displays the mapping of FCoE VLANs to VSANs. |

This example shows how to display a virtual Fibre Channel interface bound to an Ethernet interface:

```
switch# show interface vfc 3
vfc3 is up
  Bound interface is Ethernet1/37
  Hardware is Virtual Fibre Channel
  Port WWN is 20:02:00:0d:ec:6d:95:3f
  Admin port mode is F, trunk mode is on
  snmp link state traps are enabled
  Port mode is F, FCID is 0x490100
  Port vsan is 931
  1 minute input rate 0 bits/sec, 0 bytes/sec, 0 frames/sec
  1 minute output rate 0 bits/sec, 0 bytes/sec, 0 frames/sec
    0 frames input, 0 bytes
      0 discards, 0 errors
    0 frames output, 0 bytes
      0 discards, 0 errors
  Interface last changed at Thu May 21 04:44:42 2009
```

This example shows how to display a virtual Fibre Channel interface bound to a MAC address:

```
switch# show interface vfc 1001
vfc1001 is down
  Bound MAC is 00:0a:00:00:00:01
  Hardware is Virtual Fibre Channel
  Port WWN is 23:e8:00:0d:ec:6d:95:3f
  Admin port mode is F, trunk mode is on
  snmp link state traps are enabled
  Port vsan is 901
  1 minute input rate 0 bits/sec, 0 bytes/sec, 0 frames/sec
  1 minute output rate 0 bits/sec, 0 bytes/sec, 0 frames/sec
    0 frames input, 0 bytes
      0 discards, 0 errors
    0 frames output, 0 bytes
      0 discards, 0 errors
```

This example shows how to display the status of all the interfaces on the switch (some output has been removed for brevity):

```
switch# show interface brief
```

| Interface | Vsan | Admin Mode | Admin Trunk Mode | Status | SFP | Oper Mode | Oper Speed (Gbps) | Port Channel |
|-----------|------|------------|------------------|-----------|-----|-----------|-------------------|--------------|
| fc3/1 | 1 | auto | on | trunking | sw1 | TE | 2 | -- |
| fc3/2 | 1 | auto | on | sfpAbsent | -- | -- | | -- |
| ... | | | | | | | | |
| fc3/8 | 1 | auto | on | sfpAbsent | -- | -- | | -- |

```
switch# show interface
```

| Interface | Status | IP Address | Speed | MTU | Port Channel |
|--------------|------------|------------|-------|------|--------------|
| Ethernet1/1 | hwFailure | -- | -- | 1500 | -- |
| Ethernet1/2 | hwFailure | -- | -- | 1500 | -- |
| Ethernet1/3 | up | -- | 10000 | 1500 | -- |
| ... | | | | | |
| Ethernet1/39 | sfpIsAbsen | -- | -- | 1500 | -- |
| Ethernet1/40 | sfpIsAbsen | -- | -- | 1500 | -- |

```
switch# show ip interface
```

| Interface | Status | IP Address | Speed | MTU |
|-----------|--------|--------------|-------|------|
| mgmt0 | up | 172.16.24.41 | 100 | 1500 |

```
switch# show interface brief
```

| Interface | Vsan | Admin Mode | Admin Trunk Mode | Status | SFP | Oper Mode | Oper Speed (Gbps) | Port Channel |
|-----------|------|------------|------------------|--------|-----|-----------|-------------------|--------------|
| vfc 1 | 1 | F | -- | down | -- | -- | | -- |
| ... | | | | | | | | |

This example shows how to display the mapping between the VLANs and VSANs on the switch:

```
switch# show vlan fcoe
```

| VLAN | VSAN | Status |
|------|------|-----------------|
| 15 | 15 | Operational |
| 20 | 20 | Operational |
| 25 | 25 | Operational |
| 30 | 30 | Non-operational |

Mapping VSANs to VLANs Example Configuration

The following example shows how to configure the FCoE VLAN and a virtual Fibre Channel interface:

SUMMARY STEPS

1. Enable the associated VLAN and map the VLAN to a VSAN.
2. Configure the VLAN on a physical Ethernet interface.
3. Create a virtual Fibre Channel interface and bind it to a physical Ethernet interface.
4. Associate the virtual Fibre Channel interface to the VSAN.
5. (Optional) Display membership information for the VSAN.
6. (Optional) Display the interface information for the virtual Fibre Channel interface.

DETAILED STEPS

Step 1 Enable the associated VLAN and map the VLAN to a VSAN.

```
switch(config)# vlan 200
switch(config-vlan)# fcoe vsan 2
switch(config-vlan)# exit
```

Step 2 Configure the VLAN on a physical Ethernet interface.

```
switch# configure terminal
switch(config)# interface ethernet 1/4
switch(config-if)# spanning-tree port type edge trunk
switch(config-if)# switchport mode trunk
switch(config-if)# switchport trunk allowed vlan 1,200
switch(config-if)# exit
```

Step 3 Create a virtual Fibre Channel interface and bind it to a physical Ethernet interface.

```
switch(config)# interface vfc 4
switch(config-if)# bind interface ethernet 1/4
switch(config-if)# exit
```

Note By default, all virtual Fibre Channel interfaces reside on VSAN 1. If the VLAN to VSAN mapping is to a VSAN other than VSAN 1, then proceed to Step 4.

Step 4 Associate the virtual Fibre Channel interface to the VSAN.

```
switch(config)# vsan database
switch(config-vsan)# vsan 2 interface vfc 4
switch(config-vsan)# exit
```

Step 5 (Optional) Display membership information for the VSAN.

```
switch# show vsan 2 membership
vsan 2 interfaces
    vfc 4
```

Step 6 (Optional) Display the interface information for the virtual Fibre Channel interface.

```
switch# show interface vfc 4

vfc4 is up
Bound interface is Ethernet1/4
Hardware is Virtual Fibre Channel
Port WWN is 20:02:00:0d:ec:6d:95:3f
Port WWN is 20:02:00:0d:ec:6d:95:3f
```

```
snmp link state traps are enabled
Port WWN is 20:02:00:0d:ec:6d:95:3f
APort WWN is 20:02:00:0d:ec:6d:95:3f
snmp link state traps are enabled
Port mode is F, FCID is 0x490100
Port vsan is 931
1 minute input rate 0 bits/sec, 0 bytes/sec, 0 frames/sec
1 minute output rate 0 bits/sec, 0 bytes/sec, 0 frames/sec
0 frames input, 0 bytes 0 discards, 0 errors
0 frames output, 0 bytes 0 discards, 0 errors
Interface last changed at Thu Mar 11 04:44:42 2010
```

FCoE over Enhanced vPC

Although Ethernet traffic is dual homed between a FEX and a switch pair in an enhanced vPC topology, FCoE traffic must be single homed to maintain SAN isolation. Therefore, while enhanced vPC supports FCoE, a single homed FEX topology can be a better choice when SAN isolation and high FCoE bandwidth are required.

Consider the following disadvantages of enhanced vPC relative to a single homed topology:

- A typical SAN network maintains two fabrics, SAN A and SAN B, with traffic isolated between the two. In an enhanced vPC topology, each switch must be paired (single homed) with a FEX to ensure that FCoE traffic from one FEX is sent to only one switch, while Ethernet traffic is dual homed between each FEX and both switches. Because FCoE traffic from the FEX flows to only one switch while Ethernet traffic flows to both, the traffic load for the FEX uplinks is not evenly balanced.
- In a FEX with eight uplink ports, Ethernet traffic can use all eight ports, while the single homed FCoE traffic is limited by this topology to using only four of those ports, restricting the maximum bandwidth available for FCoE. As a further restriction, the default QoS template for the shared link allocates only half the link bandwidth to FCoE traffic, with the other half allocated to Ethernet traffic.
- In an enhanced vPC topology with FCoE, the host vPC is limited to two ports, one to each FEX.

The following network diagram shows the FCoE traffic flow in a system with two Nexus 2000 Fabric Extenders, each associated with a different Nexus 5000 switch.

Figure 1: FCoE over Enhanced vPC

Configuring FCoE over Enhanced vPC

FCoE traffic must be single homed to maintain SAN isolation. You must first associate a FEX with only one switch. When the FEX and switch are associated, you can then create a virtual Fibre Channel (vFC) interface and bind it to a port.

After pairing the FEX and switch on the first peer, you repeat the configuration on the second peer using a different port number to ensure SAN traffic isolation. The different configuration will not cause a consistency error because the FCoE portion of the enhanced vPC configuration is not subject to the vPC consistency check.

Before You Begin

Review the limitations in [FCoE over Enhanced vPC](#), on page 9.

SUMMARY STEPS

1. **configure terminal**
2. **fex** *fex-chassis_ID*
3. **fcoe**
4. **interface vfc** *vfc-id*
5. **bind interface ethernet** [*fex-chassis-ID*]/*slot/port*
6. **no shutdown**
7. (Optional) **end**
8. (Optional) **copy running-config startup-config**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|---|---|
| Step 1 | configure terminal Example: switch# configure terminal switch(config) # | Enters global configuration mode. |
| Step 2 | fex <i>fex-chassis_ID</i> Example: switch(config) # fex 101 switch(config-fex) # | Enters configuration mode for the specified FEX. The range for <i>fex-chassis_ID</i> is 100 to 199. |
| Step 3 | fcoe Example: switch(config-fex) # fcoe switch(config-fex) # | Configures the FEX to send FCoE traffic only to this switch. |
| Step 4 | interface vfc <i>vfc-id</i> Example: switch(config-fex) # interface vfc 1 switch(config-if) # | Enters configuration mode for the virtual Fibre Channel interface. If the interface does not already exist, this command also creates that interface. The range of <i>vfc-id</i> is 1 to 8192. |
| Step 5 | bind interface ethernet [<i>fex-chassis-ID</i>]/ <i>slot/port</i> Example: switch(config-if) # bind interface ethernet 101/1/1 switch(config-if) # | Binds the vFC interface to the specified physical Ethernet interface. The range for <i>fex-chassis_ID</i> is 100 to 199. For Cisco Nexus 5000 Platform, <i>slot</i> must be 1. For FCoE, the range for <i>port</i> is 1 to 32. |
| Step 6 | no shutdown Example: switch(config-if) # no shutdown switch(config-if) # | Returns the interface to its default operational state. |

| | Command or Action | Purpose |
|--------|--|--|
| Step 7 | end Example: switch(config-if) # end switch# | (Optional) Return to privileged EXEC mode. |
| Step 8 | copy running-config startup-config Example: switch# copy running-config startup-config | (Optional) Copies the running configuration to the startup configuration. |

This example shows how to pair each FEX to a switch for FCoE traffic:

```
nexus5000-sanA# configure terminal
nexus5000-sanA(config) # fex 101
nexus5000-sanA(config-fex) # fcoe
nexus5000-sanA(config-fex) # interface vfc 1
nexus5000-sanA(config-if) # bind interface ethernet 101/1/1
nexus5000-sanA(config-if) #no shutdown
nexus5000-sanA(config-if) # end
nexus5000-sanA# copy running-config startup-config
nexus5000-sanA#

nexus5000-sanB# configure terminal
nexus5000-sanB(config) # fex 102
nexus5000-sanB(config-fex) # fcoe
nexus5000-sanB(config-fex) # interface vfc 1
nexus5000-sanB(config-if) # bind interface ethernet 102/1/1
nexus5000-sanB(config-if) #no shutdown
nexus5000-sanB(config-if) # end
nexus5000-sanB# copy running-config startup-config
nexus5000-sanB#
```

SAN Boot with vPC

A Cisco Nexus Series switch can use SAN boot if the following conditions are met:

- The Cisco Nexus 2000 Series Fabric Extender (FEX) that contains the port assigned to the vPC must be associated with the Nexus switch.
- Only one VFC interface is bound to a vPC member. You cannot bind multiple interfaces to multiple members.

Note

If you want to ensure backward compatibility for all previous configurations and supported topologies, you must configure the FEX in a straight-through FEX topology that does not use Enhanced vPC.

SAN Boot with vPC Configuration Example

In this example, virtual Fibre Channel interface 1 is bound to physical Ethernet interface 101/1/1 on Fabric A and on interface 102/1/1 on Fabric B. The interface is also associated with virtual port channel 1 on both fabrics.

```
nexus5000-sanA(config) # interface vfc 1
nexus5000-sanA(config-if) # bind interface eth 101/1/1
nexus5000-sanA(config) # interface eth 101/1/1
nexus5000-sanA(config-if) # channel-group 1 mode active
nexus5000-sanA(config-if) # interface port-channel 1
nexus5000-sanA(config-if) # vpc 1
nexus5000-sanA(config-if) #

nexus5000-sanB(config) # interface vfc 1
nexus5000-sanB(config-if) # bind interface eth 102/1/1
nexus5000-sanB(config) # interface eth 102/1/1
nexus5000-sanB(config-if) # channel-group 1 mode active
nexus5000-sanB(config-if) # interface port-channel 1
nexus5000-sanB(config-if) # vpc 1
nexus5000-sanB(config-if) #
```
