

Cisco Wireless IP Phone 8821 and 8821-EX Wireless LAN Deployment Guide

The Cisco Wireless IP Phone 8821 and 8821-EX are adaptable for all mobile professionals, from users on the move within an office environment to nurses and doctors in a healthcare environment to associates working in the warehouse, on the sales floor, or in a call center. Staff, nurses, doctors, educators, and IT personnel can be easily reached when mobile.

This guide provides information and guidance to help the network administrator deploy the Cisco Wireless IP Phone 8821 and 8821-EX in a wireless LAN environment.

Cisco Wireless IP Phone 8821 and 8821-EX Overview

The Cisco Wireless IP Phone 8821 and 8821-EX are the platforms that provide collaboration within enterprises. It brings together the capabilities of Cisco Unified Communication applications, building upon the solid foundations of Cisco Unified Communications devices, both wired and wireless.

Cisco's implementation of 802.11 permits time sensitive applications such as voice to operate efficiently across campus wide wireless LAN (WLAN) deployments. These extensions provide fast roaming capabilities and an almost seamless flow of multimedia traffic, whilst maintaining security as the end user roams between access points.

It should be understood that WLAN uses unlicensed spectrum, and as a result it may experience interference from other devices using the unlicensed spectrum. The proliferation of devices in the 2.4 GHz spectrum, such as Bluetooth headsets, Microwave ovens, cordless consumer phones, means that the 2.4 GHz spectrum may contain more congestion than other spectrums. The 5 GHz spectrum has far fewer devices operating in this spectrum and is the preferred spectrum to operate the Cisco Wireless IP Phone 8821 and 8821-EX in order to take advantage of the 802.11a/n/ac data rates available.

Despite the optimizations that Cisco has implemented in the Cisco Wireless IP Phone 8821 and 8821-EX, the use of unlicensed spectrum means that uninterrupted communication can not be guaranteed, and there may be the possibility of voice gaps of up to several seconds during conversations. Adherence to these deployment guidelines will reduce the likelihood of these voice gaps being present, but there is always this possibility.

Through the use of unlicensed spectrum, and the inability to guarantee the delivery of messages to a WLAN device, the Cisco Wireless IP Phone 8821 and 8821-EX is not intended to be used as a medical device and should not be used to make clinical decisions.

Phone Models

The following Cisco Wireless IP Phone 8821 and 8821-EX models are available.

Below outlines the modes, frequency ranges and channels supported by each model.

Part Number	Description	Peak Antenna Gain	Frequency Ranges	Available Channels	Channel Set
CP-8821-K9=	Cisco Wireless IP Phone 8821	2.4 GHz = 2.4 dBi 5 GHz = 3.0 dBi	2.412 - 2.472 GHz	13	1-13
			5.180 - 5.240 GHz	4	36,40,44,48
			5.260 - 5.320 GHz	4	52,56,60,64
CP-8821-EX-K9=	Cisco Wireless IP Phone 8821-EX		5.500 - 5.720 GHz	12	100-144
			5.745 - 5.825 GHz	5	149,153,157,161,165

Note: 802.11j (channels 34, 38, 42, 46) are not supported.

Channel 14 for Japan is not supported.

Requirements

The Cisco Wireless IP Phone 8821 and 8821-EX are IEEE 802.11a/b/g/n/ac devices that provide voice communications.

The environment must be validated to ensure it meets the requirements to deploy the Cisco Wireless IP Phone 8821 and 8821-EX.

Site Survey

Before deploying the Cisco Wireless IP Phone 8821 and 8821-EX into a production environment, a site survey must be completed by a Cisco certified partner with the advanced wireless LAN specialization. During the site survey the RF spectrum can be analyzed to determine which channels are usable in the desired band (5 GHz or 2.4 GHz). Typically, there is less interference in the 5 GHz band as well as more non-overlapping channels, so 5 GHz is the preferred band for operation and even more highly recommended when the Cisco Wireless IP Phone 8821 and 8821-EX is to be used in a mission critical environment. The site survey will include heatmaps showing the intended coverage plan for the location. The site survey will also determine which access point platform type, antenna type, access point configuration (channel and transmit power) to use at the location. It is recommended to select an access point with integrated antennas for non-rugged environments (e.g. office, healthcare, education, hospitality) and an access point platform requiring external antennas for rugged environments (e.g. manufacturing, warehouse, retail).

The wireless LAN must be validated to ensure it meets the requirements to deploy the Cisco Wireless IP Phone 8821 and 8821-EX.

Signal

The cell edge should be designed to -67 dBm where there is a 20-30% overlap of adjacent access points at that signal level.

This ensures that the Cisco Wireless IP Phone 8821 and 8821-EX always have adequate signal and can hold a signal long enough in order to roam seamlessly where signal based triggers are utilized vs. packet loss triggers.

Also need to ensure that the upstream signal from the Cisco Wireless IP Phone 8821 and 8821-EX meets the access point's receiver sensitivity for the transmitted data rate. Rule of thumb is to ensure that the received signal at the access point is -67 dBm or higher.

It is recommended to design the cell size to ensure that the Cisco Wireless IP Phone 8821 and 8821-EX can hold a signal for at least 5 seconds.

Channel Utilization

Channel Utilization levels should be kept under 40%.

The Cisco Wireless IP Phone 8821 and 8821-EX convert the 0-255 scale value to a percentage, so 105 would equate to around 40% in the Cisco Wireless IP Phone 8821 and 8821-EX.

Noise

Noise levels should not exceed -92 dBm, which allows for a Signal to Noise Ratio (SNR) of 25 dB where a -67 dBm signal should be maintained.

Also need to ensure that the upstream signal from the Cisco Wireless IP Phone 8821 and 8821-EX meets the access point's signal to noise ratio for the transmitted data rate.

Packet Loss / Delay

Per voice guidelines, packet loss should not exceed 1% packet loss; otherwise voice quality can be degraded significantly.

Jitter should be kept at a minimal (< 100 ms).

Retries

802.11 retransmissions should be less than 20%.

Multipath

Multipath should be kept to a minimal as this can create nulls and reduce signal levels.

Call Control

The Cisco Wireless IP Phone 8821 and 8821-EX utilize Session Initiation Protocol (SIP) for call control with the following applications.

- Cisco Unified Communications Manager (CUCM)
Minimum = 9.1(2)
Recommended = 10.5(2), 11.0(1), 11.5(1), and later
- Cisco Unified Communications Manager Express (CUCME)
Minimum = 10.5
Recommended = 11.0, 11.5, 11.7, and later
- Cisco Unified Survivable Remote Site Telephony (SRST)
Minimum = 10.5
Recommended = 11.0, 11.5, 11.7, and later

Note: Cisco Unified Communications Manager requires a device package to be installed or service release update in order to enable Cisco Wireless IP Phone 8821 and 8821-EX device support.

Device packages for Cisco Unified Communications Manager are available at the following location.

<http://software.cisco.com/download/navigator.html?mdfid=278875240>

With release 10.5 of Cisco Unified Communications Manager Express, the Cisco Wireless IP Phone 8821 and 8821-EX are to utilize the fast track method utilizing the Cisco Unified IP Phone 9971 as the reference model (use 7975 as reference model if needing softkey template support).

With release 11.0 and 11.5 of Cisco Unified Communications Manager Express, the Cisco Wireless IP Phone 8821 and 8821-EX can utilize the Cisco IP Phone 8861 as the reference model.

With release 11.7 and later of Cisco Unified Communications Manager Express, there is native support for the Cisco Wireless IP Phone 8821 and 8821-EX, therefore can use the Cisco IP Phone 8821 as the model type.

http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/cucme/feature/phone_feature/phone_feature_support_guide.html# Toc436645184

Wireless LAN

The Cisco Wireless IP Phone 8821 and 8821-EX are supported on the following Cisco Wireless LAN solutions.

- Cisco Wireless LAN Controller and Cisco Lightweight Access Points
Minimum = 8.0.121.0
Recommended = 8.0.152.0, 8.2.166.0, 8.3.133.0, 8.5.120.0
- Cisco Meraki Access Points
- Cisco Autonomous Access Points
Minimum = 12.4(21a)JY
Recommended = 12.4(25d)JA2, 15.2(4)JB6, 15.3(3)JF1

Access Points

Below are the Cisco access points that are supported.

Any access point model that is not listed below is not supported.

The Cisco Wireless IP Phone 8821 and 8821-EX are supported on the following Cisco Aironet access point platforms.

Note: The Cisco Wireless IP Phone 8821 and 8821-EX are supported with the Cisco AP3600 when the internal 802.11a/b/g/n radio is utilized, however is not supported if the 802.11ac module (AIR-RM3000AC) for the Cisco AP3600 is installed.

The table below lists the modes that are supported by each Cisco Aironet access point.

Cisco AP Series	802.11a	802.11b	802.11g	802.11n	802.11ac	Lightweight	Autonomous	Mobility Express
600	Yes	Yes	Yes	Yes	No	Yes	No	No
700	Yes	Yes	Yes	Yes	No	Yes	Yes	No
700W	Yes	Yes	Yes	Yes	No	Yes	Yes	No

890	Yes	Yes	Yes	Yes	No	Yes	Yes	No

The Cisco Wireless IP Phone 8821 and 8821-EX are supported on the following Cisco Meraki access point platforms.

MX64W

MX65W

MR74

MR84

<https://meraki.cisco.com/products/wireless#models>

<https://meraki.cisco.com/products/appliances#models>

The Cisco Meraki MR12, MR16, and Z1 access point platforms are not certified for use with Cisco Wireless IP Phone 8821 and 8821-EX deployments.

Note: If an access point model is not specifically listed above, then it is not supported.

Support for Cisco Aironet 1500 Series outdoor access points is limited to local access point mode only.

No support for any access point model operating in MESH mode.

No support for 3rd party access points as there are no interoperability tests performed for 3rd party access points.

However, the user should have basic functionality when connected to a Wi-Fi compliant access point.

Some of the key features are the following:

- 5 GHz (802.11a/n/ac)
- Wi-Fi Protected Access v2 (WPA2+AES)
- Wi-Fi Multimedia (WMM)
- Traffic Specification (TSPEC)
- Traffic Classification (TCLAS)
- Differentiated Services Code Point (DSCP)
- Class of Service (CoS / 802.1p)
- QoS Basic Service Set (QBSS)

The Cisco Wireless IP Phone 8821 and 8821-EX can take advantage of Cisco Client Extensions (CCX) enabled access points.

Some of the key features are the following:

- Cisco Centralized Key Management (CCKM)

- Dynamic Transmit Power Control (DTPC)

<http://www.cisco.com/c/en/us/products/wireless/compatible-extensions.html>

Antenna Systems

Some Cisco access points require or allow external antennas.

Please refer to the following URL for the list of supported antennas for Cisco Aironet access points and how these external antennas should be mounted.

http://www.cisco.com/c/en/us/products/collateral/wireless/aironet-antennas-accessories/product_data_sheet09186a008008883b.html

3rd party antennas are not supported, as there is no interoperability testing performed against 3rd party antennas including Distributed Antenna Systems (DAS) and Leaky Coaxial Systems.

Please refer to the following URL for more info on Cisco Wireless LAN over Distributed Antenna Systems.

http://www.cisco.com/c/en/us/products/collateral/wireless/aironet-1130-ag-series/positioning_statement_c07-565470.html

Note: Cisco access points with integrated internal antennas (other than models intended to be wall mounted) are to be mounted on the ceiling as they have omni-directional antennas and are not designed to be wall mounted.

Protocols

Supported voice and wireless LAN protocols include the following:

- 802.11a,b,d,e,g,h,i,n,r,ac
- Wi-Fi MultiMedia (WMM)
- Traffic Specification (TSPEC)
- Traffic Classification (TCLAS)
- Simple Certificate Enrollment Protocol (SCEP)
- Session Initiation Protocol (SIP)
- Real Time Protocol (RTP)
- Opus, G.722, G.711, iSAC, iLBC, G.729
- Cisco Discovery Protocol (CDP)

Wi-Fi

The following table lists the data rates, ranges, and receiver sensitivity info for Cisco Wireless IP Phone 8821 and 8821-EX.

5 GHz Specifications

5 GHz - 802.11a	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 14 dBm	6 Mbps	OFDM - BPSK	-94 dBm

(Depends on region)	9 Mbps	OFDM - BPSK	-93 dBm
	12 Mbps	OFDM - QPSK	-92 dBm
	18 Mbps	OFDM - QPSK	-89 dBm
	24 Mbps	OFDM - 16 QAM	-86 dBm
	36 Mbps	OFDM - 16 QAM	-83 dBm
	48 Mbps	OFDM - 64 QAM	-78 dBm
	54 Mbps	OFDM - 64 QAM	-76 dBm
5 GHz - 802.11n (HT20)	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 13 dBm (Depends on region)	7 Mbps (MCS 0)	OFDM - BPSK	-94 dBm
	14 Mbps (MCS 1)	OFDM - QPSK	-91 dBm
	21 Mbps (MCS 2)	OFDM - QPSK	-89 dBm
	29 Mbps (MCS 3)	OFDM - 16 QAM	-86 dBm
	43 Mbps (MCS 4)	OFDM - 16 QAM	-82 dBm
	58 Mbps (MCS 5)	OFDM - 64 QAM	-77 dBm
	65 Mbps (MCS 6)	OFDM - 64 QAM	-76 dBm
	72 Mbps (MCS 7)	OFDM - 64 QAM	-74 dBm
5 GHz - 802.11n (HT40)	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 13 dBm (Depends on region)	15 Mbps (MCS 0)	OFDM - BPSK	-91 dBm
	30 Mbps (MCS 1)	OFDM - QPSK	-88 dBm
	45 Mbps (MCS 2)	OFDM - QPSK	-86 dBm
	60 Mbps (MCS 3)	OFDM - 16 QAM	-83 dBm
	90 Mbps (MCS 4)	OFDM - 16 QAM	-79 dBm
	120 Mbps (MCS 5)	OFDM - 64 QAM	-75 dBm
	135 Mbps (MCS 6)	OFDM - 64 QAM	-73 dBm
	150 Mbps (MCS 7)	OFDM - 64 QAM	-72 dBm
5 GHz - 802.11ac (VHT20)	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 12 dBm (Depends on region)	7 Mbps (MCS 0)	OFDM - BPSK	-93 dBm
	14 Mbps (MCS 1)	OFDM - QPSK	-90 dBm
	21 Mbps (MCS 2)	OFDM - QPSK	-87 dBm
	29 Mbps (MCS 3)	OFDM - 16 QAM	-84 dBm
	43 Mbps (MCS 4)	OFDM - 16 QAM	-81 dBm
	58 Mbps (MCS 5)	OFDM - 64 QAM	-76 dBm
	65 Mbps (MCS 6)	OFDM - 64 QAM	-75 dBm
	72 Mbps (MCS 7)	OFDM - 64 QAM	-74 dBm
	87 Mbps (MCS 8)	OFDM - 256 QAM	-70 dBm
5 GHz - 802.11ac (VHT40)	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 12 dBm (Depends on region)	15 Mbps (MCS 0)	OFDM - BPSK	-90 dBm
	30 Mbps (MCS 1)	OFDM - QPSK	-87 dBm
	45 Mbps (MCS 2)	OFDM - QPSK	-85 dBm
	60 Mbps (MCS 3)	OFDM - 16 QAM	-82 dBm

	90 Mbps (MCS 4)	OFDM - 16 QAM	-79 dBm
	120 Mbps (MCS 5)	OFDM - 64 QAM	-73 dBm
	135 Mbps (MCS 6)	OFDM - 64 QAM	-72 dBm
	150 Mbps (MCS 7)	OFDM - 64 QAM	-72dBm
	180 Mbps (MCS 8)	OFDM – 256 QAM	-67 dBm
	200 Mbps (MCS 9)	OFDM – 256 QAM	-66 dBm
5 GHz - 802.11ac (VHT80)	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 12 dBm (Depends on region)	33 Mbps (MCS 0)	OFDM - BPSK	-87 dBm
	65 Mbps (MCS 1)	OFDM - QPSK	-83 dBm
	98 Mbps (MCS 2)	OFDM - QPSK	-81 dBm
	130 Mbps (MCS 3)	OFDM - 16 QAM	-78 dBm
	195 Mbps (MCS 4)	OFDM - 16 QAM	-75 dBm
	260 Mbps (MCS 5)	OFDM - 64 QAM	-73 dBm
	293 Mbps (MCS 6)	OFDM - 64 QAM	-68 dBm
	325 Mbps (MCS 7)	OFDM - 64 QAM	-68 dBm
	390 Mbps (MCS 8)	OFDM – 256 QAM	-64 dBm
	433 Mbps (MCS 9)	OFDM – 256 QAM	-62 dBm

2.4 GHz Specifications

2.4 GHz - 802.11b	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 17 dBm (Depends on region)	1 Mbps	DSSS - BPSK	-98 dBm
	2 Mbps	DSSS - QPSK	-96 dBm
	5.5 Mbps	DSSS - CCK	-93 dBm
	11 Mbps	DSSS - CCK	-91 dBm
2.4 GHz - 802.11g	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 14 dBm (Depends on region)	6 Mbps	OFDM - BPSK	-95 dBm
	9 Mbps	OFDM - BPSK	-94 dBm
	12 Mbps	OFDM - QPSK	-93 dBm
	18 Mbps	OFDM - QPSK	-90 dBm
	24 Mbps	OFDM - 16 QAM	-87 dBm
	36 Mbps	OFDM - 16 QAM	-84 dBm
	48 Mbps	OFDM - 64 QAM	-79 dBm
	54 Mbps	OFDM - 64 QAM	-77 dBm
2.4 GHz - 802.11n (HT20)	Data Rate	Modulation	Receiver Sensitivity
Max Tx Power = 13 dBm (Depends on region)	7 Mbps (MCS 0)	OFDM - BPSK	-95 dBm
	14 Mbps (MCS 1)	OFDM - QPSK	-92 dBm
	21 Mbps (MCS 2)	OFDM - QPSK	-90 dBm
	29 Mbps (MCS 3)	OFDM - 16 QAM	-87 dBm
	43 Mbps (MCS 4)	OFDM - 16 QAM	-83 dBm

	58 Mbps (MCS 5)	OFDM - 64 QAM	-78 dBm
	65 Mbps (MCS 6)	OFDM - 64 QAM	-77 dBm
	72 Mbps (MCS 7)	OFDM - 64 QAM	-75 dBm

Note: Receiver sensitivity is the minimum signal needed to decode a packet at a certain data rate.

The above values are pure radio specifications and do not account for the gain of the single integrated antenna.

To achieve 802.11n/ac connectivity, it is recommended that the Cisco Wireless IP Phone 8821 and 8821-EX be within 100 feet of the access point.

Regulatory

World Mode (802.11d) allows a client to be used in different regions, where the client can adapt to using the channels and transmit powers advertised by the access point in the local environment.

The Cisco Wireless IP Phone 8821 and 8821-EX operate best when the access point is 802.11d enabled, where it can determine which channels and transmit powers to use per the local region.

Enable World Mode (802.11d) for the corresponding country where the access point is located.

Some 5 GHz channels are also used by radar technology, which requires that the 802.11 client and access point be 802.11h compliant if utilizing those radar frequencies (DFS channels). 802.11h requires 802.11d to be enabled.

The Cisco Wireless IP Phone 8821 and 8821-EX will passively scan DFS channels first before engaging in active scans of those channels.

If 802.11d is not enabled, then the Cisco Wireless IP Phone 8821 and 8821-EX can attempt to connect to the access point using reduced transmit power.

Below are the countries and their 802.11d codes that are supported by the Cisco Wireless IP Phone 8821 and 8821-EX.

Argentina (AR)	Iceland (IS)	Philippines (PH)
Australia (AU)	India (IN)	Poland (PL)
Austria (AT)	Ireland (IE)	Portugal (PT)

Bluetooth

The Cisco Wireless IP Phone 8821 and 8821-EX support Bluetooth 3.0 technology allowing for wireless headset communications.

Bluetooth enables low bandwidth wireless connections within a range of 30 feet, however it is recommended to keep the Bluetooth device within 10 feet of the Cisco Wireless IP Phone 8821 and 8821-EX.

Up to ten headsets can be paired, where the previously connected headset is given priority.

The Bluetooth device does not need to be within direct line-of-sight of the phone, but barriers, such as walls, doors, etc. can potentially impact the quality.

Bluetooth utilizes the 2.4 GHz frequency just like 802.11b/g/n and many other devices (e.g. microwave ovens, cordless phones, etc.), so the Bluetooth quality can potentially be interfered with due to using this unlicensed frequency.

Bluetooth Profiles

The Cisco Wireless IP Phone 8821 and 8821-EX support the following Bluetooth profiles.

Hands-Free Profile (HFP)

With Bluetooth Hands-Free Profile (HFP) support, the following features can be available if supported by the Bluetooth headset.

- Ring
- Answer a call
- End a call
- Volume Control
- Last Number Redial
- Call Waiting
- Divert / Reject
- 3 way calling (Hold & Accept and Release & Accept)
- Speed Dialing

Phone Book Access Profile (PBAP)

Phone Book Access Profile (PBAP) support enables the exchange of phone book objects between devices.

For more information, refer to the documentation from the Bluetooth headset manufacturer.

Coexistence (802.11b/g/n + Bluetooth)

If using Coexistence where 802.11b/g/n and Bluetooth are used simultaneously, then there are some limitations and deployment requirements to be considered as they both utilize the 2.4 GHz frequency range.

Capacity

When using Coexistence (802.11b/g/n + Bluetooth), call capacity is reduced due to the utilization of CTS to protect the 802.11g/n and Bluetooth transmissions.

Multicast Audio

Multicast audio from Push to Talk (PTT), Music on Hold (MMOH) and other applications are not supported when using Coexistence.

Voice Quality

Depending on the current data rate configuration, CTS may be sent to protect the Bluetooth transmissions when using Coexistence.

In some environments, 6 Mbps may need to be enabled.

Note: It is recommended to use 802.11a/n/ac if using Bluetooth due to 802.11b/g/n and Bluetooth both utilizing 2.4 GHz, but also due to the above limitations.

Languages

The Cisco Wireless IP Phone 8821 and 8821-EX currently support the following languages.

Arabic	French	Polish
Bulgarian	German	Portuguese
Catalan	Greek	Romanian
Chinese	Hebrew	Russian
Croatian	Hungarian	Serbian
Czech	Italian	Slovak
Danish	Japanese	Slovenian
Dutch	Korean	Spanish
English	Latvian	Swedish
Estonian	Lithuanian	Thai
Finnish	Norwegian	Turkish

The corresponding locale package must be installed to enable support for that language. English is the default language on the phone.

Download the locale packages from the Localization page at the following URL:

<http://software.cisco.com/download/navigator.html?mdfid=278875240>

8821-EX Certifications

The Cisco Wireless IP Phone 8821-EX is certified for Canadian Standards Association (CSA) Class I Division 2 and Atmospheres Explosibles (ATEX) Class I Zone 2.

Certification ensures that the equipment is fit for its intended purpose and that adequate information is supplied with it to ensure that it can be used safely.

Canadian Standards Association (CSA) Class I Division 2

Laws and regulations in most municipalities, states, and provinces in North America require certain products to be tested to a specific standard or group of standards when they are to be classified safe when used in an explosive environment.

In North America, hazardous locations have traditionally been defined by the following combination of Class and Division:

- **Class I** - A location where a quantity of flammable gas or vapor, sufficient to produce an explosive or ignitable mixture, may be present in the air.
- **Class II** - A location made hazardous by the presence of combustible elements.
- **Class III** - A location made hazardous by the presence of easily ignitable fibers in the air.

- **Division 1** - A location where a classified hazard is likely to exist.
- **Division 2** - A location where a classified hazard does not normally exist but is possible under abnormal conditions.

More recently in North America, for Class I hazards, locations can be classified under the zone system as defined by the IEC/ATEX mentioned below.

Atmospheres Explosibles (ATEX) Class I Zone 2

Equipment and protective systems intended for use in potentially explosive atmospheres must comply with **ATEX Directive 94/9/EC**.

Areas classified into zones must be protected from effective sources of ignition.

Locations where explosive gas atmospheres are likely to be present are divided into IEC/EU-defined Zones (Class I Zone 0, 1, 2 for locations with flammable gases or vapors and Class II Zone 20, 21, 22 for locations with combustible dust or ignitable fibers).

Class I

- **Zone 0** - An area in which an explosive gas atmosphere is continuously present or present for long periods.
- **Zone 1** - An area in which an explosive gas atmosphere is likely to occur in normal operation.
- **Zone 2** - An area in which an explosive gas atmosphere does not normally exist, or if they do occur, will exist only for a short period of time.

Class II

- **Zone 20** - An area in which an ignitable concentrations of combustible dust or ignitable fibers/flyings are present continuously or for long periods of time under normal operating conditions.
- **Zone 21** - An area in which an ignitable concentrations of combustible dust or ignitable fibers/flyings are likely to exist under normal operating conditions.
- **Zone 22** - An area in which an ignitable concentrations of combustible dust or ignitable fibers/flyings are not likely to exist under normal operating conditions.

Battery Life

The Cisco Wireless IP Phone 8821 and 8821-EX have a 2060 mAh smart battery.

The Cisco Wireless IP Phone 8821 and 8821-EX battery's capacity will be reduced to 80% after 500 full charging cycles (charging from empty to full).

The table below lists the maximum on call and idle times per scan mode.

Call State	Scan Mode	Battery Time
On Call	Continuous	Up to 13 hours
	Auto	Up to 13 hours
Idle	Continuous	Up to 60 hours
	Auto	Up to 220 hours

There are many factors that can influence actual battery life time.

Usage

Battery life will be reduced when the Cisco Wireless IP Phone 8821 or 8821-EX user is on call, turning the display on, using Bluetooth, using applications, receiving XSI messages, or navigating the menus on the phone.

If using XSI applications or waking up the display frequently, it is recommended to set the display sleep timer under **Settings > Phone settings > Display > Sleep** to **10 seconds** and set the brightness level under **Settings > Phone settings > Display > Brightness** to level 5.

Coverage

Ensure the Cisco Wireless IP Phone 8821 and 8821-EX remain in a good RF coverage area and is able to maintain a constant connection to the Cisco Unified Communications Manager.

If the Cisco Wireless IP Phone 8821 or 8821-EX user travels out of range and remains out of range for a significant duration, battery life can be reduced.

Scan Mode

The Cisco Wireless IP Phone 8821 and 8821-EX supports 3 different scan modes (**Continuous**, **Auto**, **Single AP**), where **Continuous** is the default configuration.

The configured scan mode will determine the battery life baseline.

- **Continuous** scan mode is designed for Cisco Wireless IP Phone 8821 and 8821-EX users that are constantly on the move where frequent roaming events occur and to maximize performance and connectivity, but power consumption is higher.
- **Auto** scan mode is designed for Cisco Wireless IP Phone 8821 and 8821-EX users that roam occasionally and require more idle battery life than **Continuous** scan mode can offer.
- **Single AP** scan mode is designed for Cisco Wireless IP Phone 8821 and 8821-EX users that do not roam and require maximum idle battery life.

Proxy ARP

For optimal idle battery life, it is recommended to utilize an access point that supports the Proxy ARP feature. Proxy ARP allows the Cisco Wireless IP Phone 8821 and 8821-EX to remain in suspend mode longer versus having to wake up at each DTIM period, therefore reducing power consumption.

If the access point does not support Proxy ARP, then the Cisco Wireless IP Phone 8821 and 8821-EX must wake up at each DTIM period, which can reduce idle battery life as much as 50%.

Transmit Power

It is recommended to utilize an access point that supports the Cisco Compatible Extensions (CCX) Dynamic Transmit Power Control (DTPC) feature. When DTPC is enabled, the access point will advertise its transmit power to all clients, where the Cisco Wireless IP Phone 8821 and 8821-EX can then adjust its transmit power to a minimum level that is only necessary to communicate with the connected access point, therefore also reducing unnecessary noise in other areas.

Multicast

If the Cisco Wireless IP Phone 8821 or 8821-EX subscribes to a multicast stream, then the Cisco Wireless IP Phone 8821 or 8821-EX must wake up at each DTIM period to receive the multicast frames, therefore power consumption is increased.

Power Save Protocol

The access point must support U-APSD, which is the power save protocol that will be utilized when on call and when in idle.

On Call Power Save in the Wi-Fi Profile should remain **Enabled** so the Cisco Wireless IP Phone 8821 and 8821-EX can utilize U-APSD.

If **On Call Power Save** is Disabled, then the Cisco Wireless IP Phone 8821 and 8821-EX will utilize active mode when on call, but still use U-APSD when in idle.

Only disable **On Call Power Save** for troubleshooting purposes.

Phone Care

The Cisco Wireless IP Phone 8821 and 8821-EX are designed to provide protection from dust, liquid splashes, and moisture.

For standard cleaning, can use a soft, moist cloth to wipe the phone. For thorough cleaning, we recommend using Caviwipes™ or Saniwipes™.

Caviwipes and Saniwipes contain up to 17% isopropanol. Any cleaning solution containing a higher amount of isopropanol, including pure isopropanol, or an alternative alcohol-based liquid could potentially damage the phone.

Do not use bleach or other caustic products to clean the phone.

Do not use compressed air to clean the phone as it can damage the phone and voids the phone warranty.

Carry cases can additionally help protect the phone further and provide drop protection.

For more information, refer to the Cisco Wireless IP Phone 8821 and 8821-EX User Guide at this URL:

<https://www.cisco.com/c/en/us/support/collaboration-endpoints/unified-ip-phone-8800-series/products-user-guide-list.html>

Accessories

The following accessories are available for the Cisco Wireless IP Phone 8821 and 8821-EX.

- Batteries

- Phone Power Supply
- Holster Case
- Leather Case
- Lanyard
- Desktop Charger
- Multicharger

For more information, refer to the Cisco Wireless IP Phone 8821 Series Accessory Guide at this URL:

<https://www.cisco.com/c/en/us/support/collaboration-endpoints/unified-ip-phone-8800-series/products-user-guide-list.html>

3rd Party Accessories

Only the 3rd party accessories listed below are certified for use with the Cisco Wireless IP Phone 8821 and 8821-EX.

- Headsets
 - Apple (www.apple.com)
 - Jabra (www.jabra.com)
 - Plantronics (www.plantronics.com)
 - Sennheiser (www.sennheiser.com)
- USB to Ethernet Dongles
 - Apple USB 2.0 Ethernet Adapter (www.apple.com)
 - Belkin B2B048 USB 3.0 Gigabit Ethernet Adapter (www.belkin.com)
 - D-Link DUB-E100 USB 2.0 Fast Ethernet Adapter (www.dlink.com)
 - Linksys USB3GIG USB 3.0 Gigabit Ethernet Adapter (www.linksys.com)
 - Linksys USB300M USB 2.0 Ethernet Adapter (www.linksys.com)

Wireless LAN Design

The following network design guidelines must be followed in order to accommodate for adequate coverage, call capacity and seamless roaming for the Cisco Wireless IP Phone 8821 and 8821-EX.

802.11 Network

Use the following guidelines to assist with deploying and configuring the wireless LAN.

5 GHz (802.11a/n/ac)

5 GHz is the recommended frequency band to utilize for operation of the Cisco Wireless IP Phone 8821 and 8821-EX.

In general, it is recommended for access points to utilize automatic channel selection instead of manually assigning channels to access points.

If there is an intermittent interferer, then the access point or access points serving that area may need to have a channel statically assigned.

The Cisco Wireless IP Phone 8821 and 8821-EX support Dynamic Frequency Selection (DFS) and Transmit Power Control (TPC) from 802.11h, which are required when using channels operating at 5.260 - 5.720 GHz, which are 15 of the 24 possible channels.

Need to ensure there is at least 20 percent overlap with adjacent channels when deploying the Cisco Wireless IP Phone 8821 and 8821-EX in an 802.11a/n/ac environment, which allows for seamless roaming. For critical areas, it is recommended to increase the overlap (30% or more) to ensure that there can be at least 2 access points available with -67 dBm or better, while the Cisco Wireless IP Phone 8821 and 8821-EX also meet the access point's receiver sensitivity (required signal level for the current data rate).

Channel ID	36	40	44	48	52	56	60	64	100	104	108	112	116	120	124	128	132	136	140	149	153	157	161
Center Freq. MHz	5180	5200	5220	5240	5260	5280	5300	5320	5500	5520	5540	5560	5580	5600	5620	5640	5660	5680	5700	5745	5765	5785	5805
Band	UNII-1				UNII-2														UNII-3				

Dynamic Frequency Selection (DFS)

DFS dynamically instructs a transmitter to switch to another channel whenever radar signal is detected. If the access point detects radar, the radio on the access point goes on hold for at least 60 seconds while the access point passively scans for another usable channel.

TPC allows the client and access point to exchange information, so that the client can dynamically adjust the transmit power. The client uses only enough energy to maintain association to the access point at a given data rate. As a result, the client contributes less to adjacent cell interference, which allows for more densely deployed, high-performance wireless LANs.

If there are repeated radar events detected by the access point (just or falsely), determine if the radar signals are impacting a single channel (narrowband) or multiple channels (wideband), then potentially disable use of that channel or channels in the wireless LAN.

The presence of an access point on a non-DFS channel can help minimize voice interruptions.

In case of radar activity, have at least one access point per area that uses a non-DFS channel (UNII-1). This ensures that a channel is available when an access point's radio is in its hold-off period while scanning for a new usable channel.

A UNII-3 channel (5.745 - 5.825 GHz) can optionally be used if available.

Below is a sample 5 GHz wireless LAN deployment.

For 5 GHz, 25 channels are available in the Americas, 16 channels in Europe, and 19 channels in Japan.

Where UNII-3 is available, it is recommended to use UNII-1, UNII-2, and UNII-3 only to utilize a 12 channel set.

If planning to use UNII-2 extended channels (channels 100 - 144), it is recommended to disable UNII-2 (channels 52-64) on the access point to avoid having so many channels enabled.

Having many 5 GHz channels enabled in the wireless LAN can delay discovery of new access points.

2.4 GHz (802.11b/g/n)

In general, it is recommended for access points to utilize automatic channel selection instead of manually assigning channels to access points.

If there is an intermittent interferer, then the access point or access points serving that area may need to have a channel statically assigned.

In a 2.4 GHz (802.11b/g/n) environment, only non-overlapping channels must be utilized when deploying VoWLAN. Non-overlapping channels have 22 MHz of separation and are at least 5 channels apart.

There are only 3 non-overlapping channels in the 2.4 GHz frequency range (channels 1, 6, 11).

Non-overlapping channels must be used and allow at least 20 percent overlap with adjacent channels when deploying the Cisco Wireless IP Phone 8821 and 8821-EX in an 802.11b/g/n environment, which allows for seamless roaming.

Using an overlapping channel set such as 1, 5, 9, 13 is not a supported configuration.

Below is a sample 2.4 GHz wireless LAN deployment.

Signal Strength and Coverage

To ensure acceptable voice quality, the Cisco Wireless IP Phone 8821 and 8821-EX should always have a signal of -67 dBm or higher when using 5 GHz or 2.4 GHz, while the Cisco Wireless IP Phone 8821 and 8821-EX also meet the access point's receiver sensitivity required signal level for the transmitted data rate.

Ensure the Packet Error Rate (PER) is no higher than 1%.

A minimum Signal to Noise Ratio (SNR) of 25 dB = -92 dBm noise level with -67 dBm signal should be maintained.

It is recommended to have at least two access points on non-overlapping channels with at least -67 dBm signal with the 25 dB SNR to provide redundancy.

To achieve maximum capacity and throughput, the wireless LAN should be designed to 24 Mbps. Higher data rates can optionally be enabled for other applications other than voice only that can take advantage of these higher data rates.

Recommended to set the minimum data rate to 11 Mbps or 12 Mbps for 2.4 GHz (dependent upon 802.11b client support policy) and 12 Mbps for 5 GHz, which should also be the only rate configured as a mandatory / basic rate. In some environments, 6 Mbps may need to be enabled as a mandatory / basic rate.

Due to the above requirements, a single channel plan should not be deployed.

When designing the placement of access points, be sure that all key areas have adequate coverage (signal).

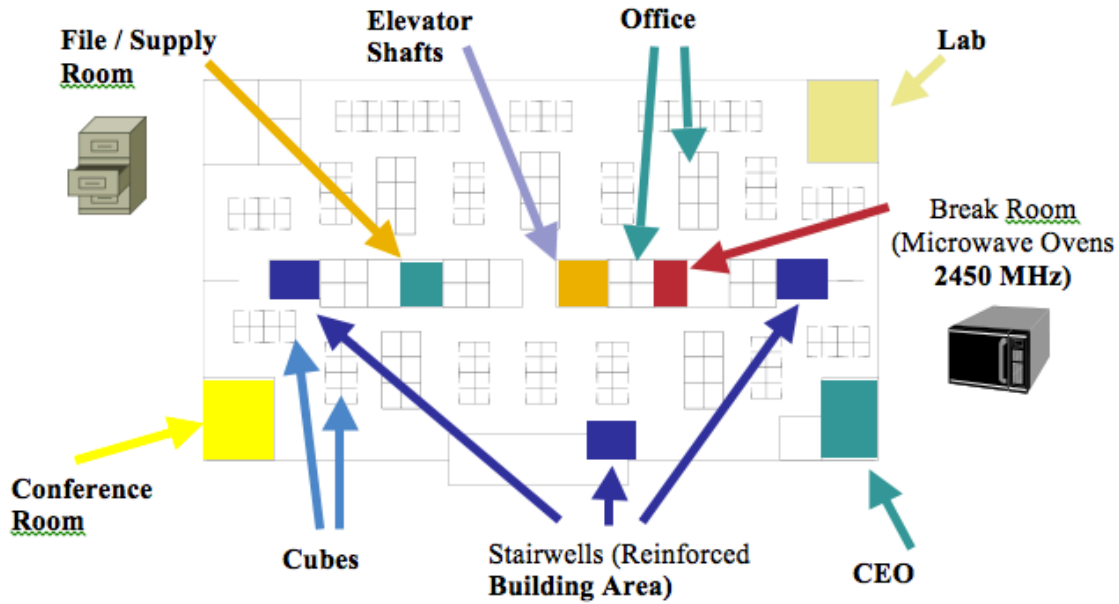

Typical wireless LAN deployments for data only applications do not provide coverage for some areas where VoWLAN service is necessary such as elevators, stairways, and outside corridors.

Microwave ovens, 2.4 GHz cordless phones, Bluetooth devices, or other electronic equipment operating in the 2.4 GHz band will interfere with the Wireless LAN.

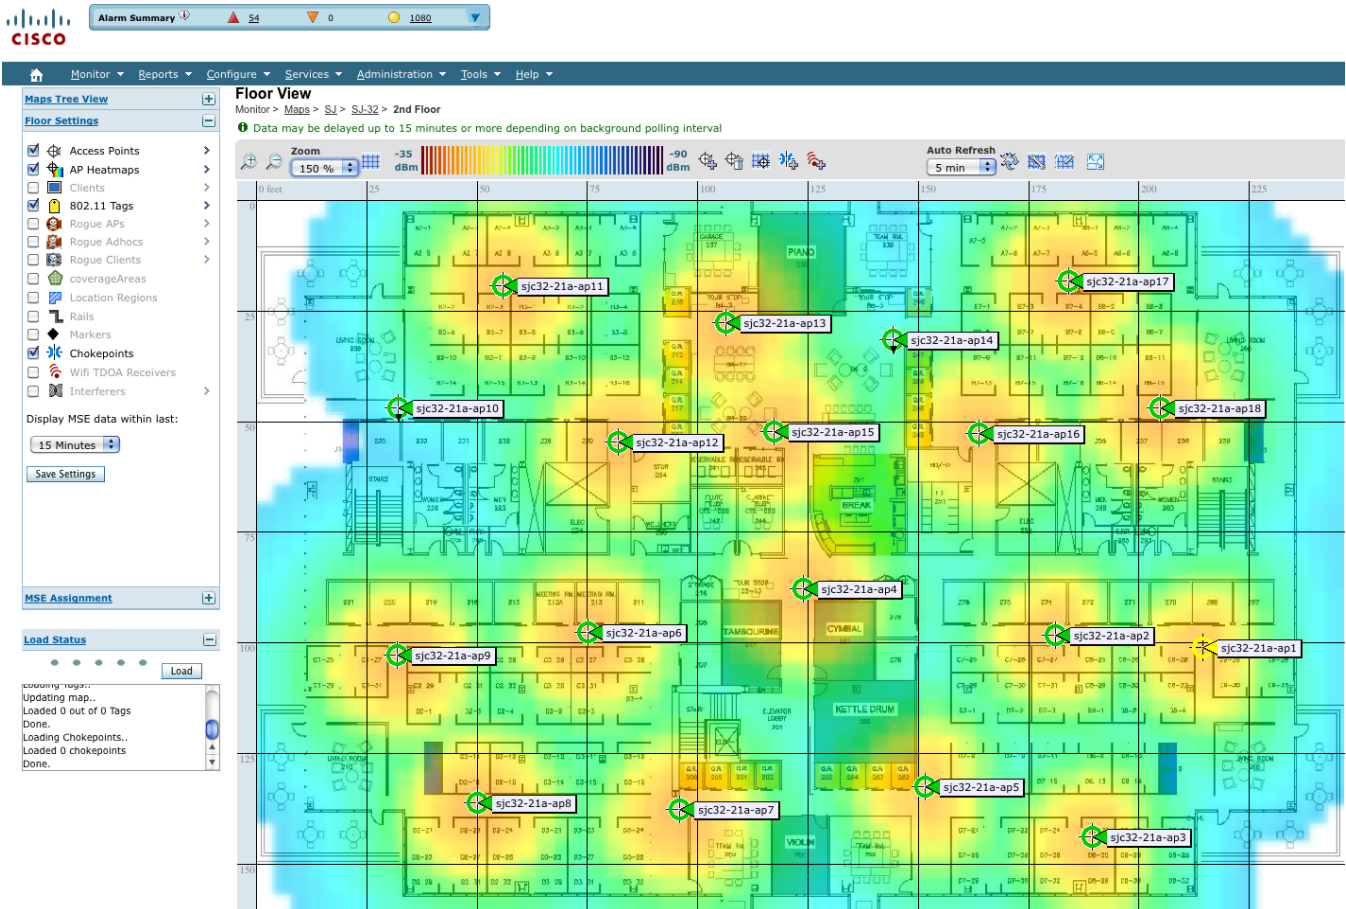

Microwave ovens operate on 2450 MHz, which is between channels 8 and 9 of 802.11b/g/n. Some microwaves are shielded more than others and that shielding reduces the spread of the energy. Microwave energy can impact channel 11, and some microwaves can affect the entire frequency range (channels 1 through 11). To avoid microwave interference, select channel 1 for use with access points that are located near microwaves.

Most microwave ovens, Bluetooth, and frequency hopping devices do not have the same effect on the 5 GHz frequency. The 802.11a/n/ac technology provides more non-overlapping channels and typically lower initial RF utilization. For voice deployments, it is suggested to use 802.11a/n/ac for voice and use 802.11b/g/n for data.

However there are products that also utilize the non-licensed 5 GHz frequency (e.g. 5.8 GHz cordless phones, which can impact UNII-3 channels).

The Cisco Unified Network Control System (NCS) or Cisco Prime Infrastructure can be utilized to verify signal strength and coverage.

Data Rates

It is recommended to disable rates below 12 Mbps for 5 GHz deployments and below 12 Mbps for 2.4 GHz deployments where capacity and range are factored in for best results.

The Cisco Wireless IP Phone 8821 and 8821-EX both have a single antenna, therefore it supports up to MCS 7 data rates for 802.11n (up to 150 Mbps) and up to MCS 9 data rates for 802.11ac (up to 433 Mbps).

Higher MCS rates can be left enabled for other 802.11n/ac clients, which are utilizing the same band frequency and utilize MIMO (multiple input / multiple output) antenna technology, which can take advantage of those higher rates.

If 802.11b clients are not allowed in the wireless network, then it is strongly recommended to disable the data rates below 12 Mbps. This will eliminate the need to send CTS frames for 802.11g/n protection as 802.11b clients can not detect these OFDM frames.

When 802.11b clients exist in the wireless network, then an 802.11b rate must be enabled and only an 802.11b rate can be configured as a mandatory / basic rate.

The recommended data rate configurations are the following:

802.11 Mode	Mandatory Data Rates	Supported Data Rates	Disabled Data Rates
802.11a/n/ac	12 Mbps	18-54 Mbps, VHT MCS 1 - MCS 9	6, 9 Mbps, VHT MCS 0
802.11a/n	12 Mbps	18-54 Mbps, HT MCS 1 - MCS 7 (HT MCS 8 - MCS 23)	6, 9 Mbps, HT MCS 0
802.11g/n	12 Mbps	18-54 Mbps, HT MCS 1 - MCS 7 (HT MCS 8 - MCS 23)	1, 2, 5.5, 6, 9, 11 Mbps, HT MCS 0
802.11b/g/n	11 Mbps	12-54 Mbps, HT MCS 1 - MCS 7 (HT MCS 8 - MCS 23)	1, 2, 5.5, 6, 9 Mbps, HT MCS 0
802.11a	12 Mbps	18-54 Mbps	6, 9 Mbps
802.11g	12 Mbps	18-54 Mbps	1, 2, 5.5, 6, 9, 11 Mbps
802.11b/g	11 Mbps	12-54 Mbps	1, 2, 5.5, 6, 9 Mbps
802.11b	11 Mbps	None	1, 2, 5.5 Mbps

For a voice only application, data rates higher than 24 Mbps can optionally be enabled or disabled, but there is no advantage from a capacity or throughput perspective and enabling these rates could potentially increase the number of retries for a data frame.

Other applications such as video may be able to benefit from having these higher data rates enabled.

To preserve high capacity and throughput, data rates of 24 Mbps and higher should be enabled.

If deploying in an environment where excessive retries may be a concern, then a limited set of the data rates can be used (e.g. 12, 24, 54, MCS 1, MCS 4, MCS 7), where the lowest enabled rate is the mandatory / basic rate.

For rugged environments or deployments requiring maximum range, it is recommended to enable 6 Mbps as a mandatory / basic rate.

Note: Some environments may require that a lower data rate be enabled due to use of legacy clients, environmental factors or maximum range is required.

Set only the lowest data rate enabled as the single mandatory / basic rate. Multicast packets will be sent at the highest mandatory / basic data rate enabled.

Note that capacity and throughput are reduced when lower rates are enabled.

Rugged Environments

When deploying the Cisco Wireless IP Phone 8821 and 8821-EX in a rugged environment (e.g. manufacturing, warehouse, retail), additional tuning on top of the standard design recommendations may be necessary.

Below are the key items to focus on when deploying a wireless LAN in a rugged environment.

Access Point and Antenna Selection

For rugged environments, it is recommended to select an access point platform that requires external antennas (e.g. Cisco 1602e, 2602e, 3502e, 3602e, and 3702e Series Access Points). It is also important to ensure an antenna type is selected which can operate well in rugged environments.

Access Point Placement

It is crucial that line of sight to the access point's antennas is maximized by minimizing any obstructions between the Cisco Wireless IP Phone 8821 or 8821-EX and the access point. Ensure that the access point and/or antennas are not mounted behind any obstruction or on or near a metal or glass surface.

If access points with integrated internal antennas are to be used in some areas, then it is recommended to mount those access points on the ceiling as they have omni-directional antennas and are not designed to be wall mounted.

Frequency Band

As always, it is recommended to use 5 GHz. Use of 2.4 GHz, especially when 802.11b rates are enabled, may not work well.

For the 5 GHz channel set, it is recommended to use a 8 or 12 channel plan only; disable UNII-2 extended channels if possible.

Data Rates

The standard recommended data rate set may not work well if multipath is present at an elevated level.

Therefore, it is recommended to enable lower data rates (e.g. 6 Mbps) to operate better in such an environment.

If using for voice only, then data rates above 24 Mbps can be disabled to increase first transmission success. If the same band is also used for data, video or other applications, then is suggested to keep the higher data rates enabled.

Transmit Power

Due to the potential of elevated multipath in rugged environments, the transmit power of the access point and Cisco Wireless IP Phone 8821 and 8821-EX should also be restricted. This is more important if planning to deploy 2.4 GHz in a rugged environment.

If using auto transmit power, the access point transmit power can be configured to use a specified range (maximum and minimum power levels) to prevent the access point from transmitting too hot as well as too weak (e.g. 5 GHz maximum of 16 dBm and minimum of 11 dBm).

The Cisco Wireless IP Phone 8821 and 8821-EX will utilize the access point's current transmit power setting to determine what transmit power it uses for transmitted frames when DTPC is enabled in the access point's configuration.

Fast Roaming

It is recommended to utilize 802.11r / Fast Transition (FT) for fast roaming. Enabling 802.11r (FT) also reduces the number of frames in the handshake when roaming to only two frames. Reducing the number of frames during a roam, increases the chances of roam success.

When using 802.1x authentication, it is important to use the recommended EAPOL key settings.

Quality of Service (QoS)

Need to ensure that DSCP values are preserved throughout the wired network, so that the WMM UP tag for voice and call control frames can be set correctly.

Beamforming

If using Cisco 802.11n capable access points, then Beamforming (ClientLink) should be enabled, which can help with client reception.

Multipath

Multipath occurs when RF signals take multiple paths from a source to a destination.

A part of the signal goes to the destination while another part bounces off an obstruction, then goes on to the destination. As a result, part of the signal encounters delay and travels a longer path to the destination, which creates signal energy loss.

When the different waveforms combine, they cause distortion and affect the decoding capability of the receiver, as the signal quality is poor.

Multipath can exist in environments where there are reflective surfaces (e.g. metal, glass, etc.). Avoid mounting access points on these surfaces.

Below is a list of multipath effects:

Data Corruption

Occurs when multipath is so severe that the receiver is unable to detect the transmitted information.

Signal Nulling

Occurs when the reflected waves arrive exactly out of phase with the main signal and cancel the main signal completely.

Increased Signal Amplitude

Occurs when the reflected waves arrive in phase with the main signal and add on to the main signal thereby increasing the signal strength.

Decreased Signal Amplitude

Occurs when the reflected waves arrive out of phase to some extent with the main signal thereby reducing the signal amplitude.

Use of Orthogonal Frequency Division Multiplexing (OFDM), which is used by 802.11a/n/ac and 802.11g/n, can help to reduce issues seen in high multipath environments.

If using 802.11b in a high multipath environment, lower data rates should be used in those areas (e.g. 1 and 2 Mbps).

Use of antenna diversity can also help in such environments.

Security

When deploying a wireless LAN, security is essential.

The Cisco Wireless IP Phone 8821 and 8821-EX support the following wireless security features.

WLAN Authentication

- WPA2 and WPA (802.1x authentication)
- WPA2-PSK and WPA-PSK (Pre-Shared key)
- EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling)
- EAP-TLS (Extensible Authentication Protocol - Transport Layer Security)
- PEAP-GTC (Protected Extensible Authentication Protocol - Generic Token Card)
- PEAP-MSCHAPv2 (Protected Extensible Authentication Protocol - Microsoft Challenge Handshake Authentication Protocol version 2)
- 802.11r / Fast Transition (FT)
- CCKM (Cisco Centralized Key Management)
- None

WLAN Encryption

- AES (Advanced Encryption Standard)
- TKIP / MIC (Temporal Key Integrity Protocol / Message Integrity Check)
- WEP (Wired Equivalent Protocol) 40/64 and 104/128 bit

Note: The access point must support AES as TKIP can only be used as the broadcast/multicast cipher.

Shared Key authentication is not supported.

The Cisco Wireless IP Phone 8821 and 8821-EX also support the following additional security features.

- Image authentication
- Device authentication
- File authentication
- Signaling authentication
- Secure Cisco Unified SRST
- Media encryption (SRTP)
- Signaling encryption (TLS)

- Certificate authority proxy function (CAPF)
- Secure profiles
- Encrypted configuration files
- Settings Access (can limit user access to configuration menus)

Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling (EAP-FAST)

Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling (EAP-FAST) encrypts EAP transactions within a Transport Level Security (TLS) tunnel between the access point and the Remote Authentication Dial-in User Service (RADIUS) server such as the Cisco Access Control Server (ACS) or Cisco Identity Services Engine (ISE).

The TLS tunnel uses Protected Access Credentials (PACs) for authentication between the client (the Cisco Wireless IP Phone 8821 and 8821-EX) and the RADIUS server. The server sends an Authority ID (AID) to the client, which in turn selects the appropriate PAC. The client returns a PAC-Opaque to the RADIUS server. The server decrypts the PAC with its master-key. Both endpoints now have the PAC key and a TLS tunnel is created. EAP-FAST supports automatic PAC provisioning, but it must be enabled on the RADIUS server.

To enable EAP-FAST, a certificate must be installed on to the RADIUS server.

The Cisco Wireless IP Phone 8821 and 8821-EX currently support automatic provisioning of the PAC only, so enable **Allow anonymous in-band PAC provisioning** on the RADIUS server as shown below.

Both EAP-GTC and EAP-MSCHAPv2 must be enabled when **Allow anonymous in-band PAC provisioning** is enabled.

EAP-FAST requires that a user account be created on the authentication server.

Allow EAP-FAST
 EAP-FAST Inner Methods
 Allow EAP-MS-CHAPv2
 Allow Password Change Retries:
 Allow EAP-GTC
 Allow Password Change Retries:
 Allow TLS-Renegotiation
 Use PACs Don't Use PACs
 Tunnel PAC Time To Live:
 Proactive PAC update will occur after % of PAC Time To Live has expired
 Allow Anonymous In-Band PAC Provisioning
 Allow Authenticated In-Band PAC Provisioning
 Server Returns Access Accept After Authenticated Provisioning
 Allow Machine Authentication
 Machine PAC Time To Live:
 Enable Stateless Session Resume
 Authorization PAC Time To Live:

If anonymous PAC provisioning is not allowed in the production wireless LAN environment then a staging RADIUS server can be setup for initial PAC provisioning of the Cisco Wireless IP Phone 8821 and 8821-EX.

This requires that the staging RADIUS server be setup as a slave EAP-FAST server and components are replicated from the product master EAP-FAST server, which include user and group database and EAP-FAST master key and policy info.

Ensure the production master EAP-FAST RADIUS server is setup to send the EAP-FAST master keys and policies to the staging slave EAP-FAST RADIUS server, which will then allow the Cisco Wireless IP Phone 8821 and 8821-EX to use the provisioned PAC in the production environment where **Allow anonymous in-band PAC provisioning** is disabled.

When it is time to renew the PAC, then authenticated in-band PAC provisioning will be used, so ensure that **Allow authenticated in-band PAC provisioning** is enabled.

Ensure that the Cisco Wireless IP Phone 8821 and 8821-EX has connected to the network during the grace period to ensure it can use its existing PAC created either using the active or retired master key in order to get issued a new PAC.

Is recommended to only have the staging wireless LAN pointed to the staging RADIUS server and to disable the staging access point radios when not being used.

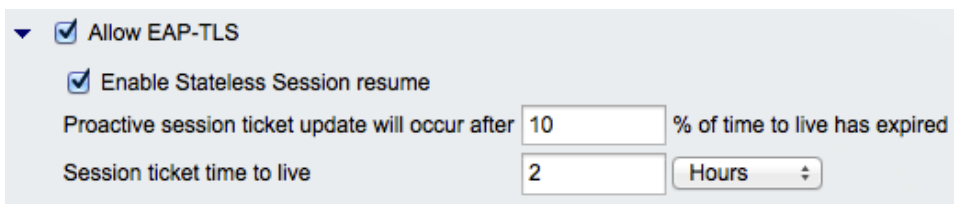

Extensible Authentication Protocol - Transport Layer Security (EAP-TLS)

Extensible Authentication Protocol - Transport Layer Security (EAP-TLS) is using the TLS protocol with PKI to secure communications to the authentication server.

TLS provides a way to use certificates for both user and server authentication and for dynamic session key generation.

A certificate is required to be installed.

EAP-TLS provides excellent security, but requires client certificate management.

▼ Allow EAP-TLS

Enable Stateless Session resume

Proactive session ticket update will occur after % of time to live has expired

Session ticket time to live

EAP-TLS may also require a user account to be created on the authentication server matching the common name of the certificate imported into the Cisco Wireless IP Phone 8821 or 8821-EX.

It is recommended to use a complex password for this user account and that EAP-TLS is the only EAP type enabled on the RADIUS server.

Protected Extensible Authentication Protocol (PEAP)

Protected Extensible Authentication Protocol (PEAP) uses server-side public key certificates to authenticate clients by creating an encrypted SSL/TLS tunnel between the client and the authentication server.

The ensuing exchange of authentication information is then encrypted and user credentials are safe from eavesdropping.

PEAP-GTC and PEAP-MSCHAPv2 are supported inner authentication protocols.

PEAP requires that a user account be created on the authentication server.

The authentication server can be validated via importing a certificate into the Cisco Wireless IP Phone 8821 and 8821-EX.

For more information on Cisco Secure Access Control System (ACS) and Cisco Identity Services Engine (ISE), refer to the following links.

<http://www.cisco.com/c/en/us/products/security/secure-access-control-system/datasheet-listing.html>

<http://www.cisco.com/c/en/us/products/security/identity-services-engine/datasheet-listing.html>

EAP and User Database Compatibility

The following chart displays the EAP and database configurations supported by the Cisco Wireless IP Phone 8821 and 8821-EX.

Database Type	EAP-FAST (Phase Zero)	EAP-TLS	PEAP-GTC	PEAP-MSCHAPv2
Cisco ACS	Yes	Yes	Yes	Yes
Windows SAM	Yes	No	Yes	Yes
Windows AD	Yes	Yes	Yes	Yes
LDAP	No	Yes	Yes	No
ODBC (ACS for Windows Only)	Yes	Yes	Yes	Yes
LEAP Proxy RADIUS Server	Yes	No	Yes	Yes
All Token Servers	No	No	No	No

Quality of Service (QoS)

Quality of Service enables queuing to ensure high priority for voice traffic.

To enable proper queuing for voice and call control traffic use the following guidelines.

- Ensure that **WMM** is enabled on the access point.
- Create a QoS policy on the access point giving priority to voice and call control traffic.

Traffic Type	DSCP	802.1p	WMM UP	Port Range
Voice	EF (46)	5	6	UDP 16384 - 32767
Call Control	CS3 (24)	3	4	TCP/UDP 5060 - 5061

- Be sure that voice and call control packets have the proper QoS markings and other protocols are not using the same QoS markings.
- Enable Differentiated Services Code Point (DSCP) preservation on the Cisco IOS switch.

For more information about TCP and UDP ports used by the Cisco Wireless IP Phone 8821 and 8821-EX and the Cisco Unified Communications Manager, refer to the Cisco Unified Communications Manager TCP and UDP Port Usage document at this URL:

http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/cucm/port/10_0_1/CUCM_BK_T537717B_00_tcp-port-usage-guide-100.html

Call Admission Control (CAC)

Call Admission Control can be enabled on the access point.

- Enable Call Admission Control (CAC) / Wi-Fi MultiMedia Traffic Specifications (TSPEC) for Voice
- Set the desired maximum RF bandwidth that is allocated for voice traffic (default = 75%)
- Set the bandwidth that is reserved for roaming voice clients (default = 6%)

Pre-Call Admission Control

If Call Admission Control is enabled on the access point, the Cisco Wireless IP Phone 8821 and 8821-EX will send an Add Traffic Stream (ADDTS) to the access point to request bandwidth in order to place or receive a call.

If the AP sends an ADDTS successful message then the Cisco Wireless IP Phone 8821 or 8821-EX establishes the call.

If the access point rejects the call and the Cisco Wireless IP Phone 8821 or 8821-EX has no other access point to roam to, then the phone will display **Network Busy**.

If the admission is refused for an inbound call there is no messaging from the Cisco Wireless IP Phone 8821 or 8821-EX to inform the remote endpoint that there is insufficient bandwidth to establish the call, so the call can continue to ring out within the system until the remote user terminates the call.

Roaming Admission Control

During a call, the Cisco Wireless IP Phone 8821 and 8821-EX measure Received Signal Strength Indicator (RSSI) and Packet Error Rate (PER) values for the current and all available access points to make roaming decisions.

If the original access point where the call was established had Call Admission Control enabled, then the Cisco Wireless IP Phone 8821 and 8821-EX will send an ADDTS request during the roam to the new access point, which embedded in the reassociation request frame.

Traffic Classification (TCLAS)

Traffic Classification (TCLAS) helps to ensure that the access point properly classifies voice packets.

Without proper classification, voice packets will be treated as best effort, which will defeat the purpose of TSPEC and QoS in general.

TCP and UDP port information will be used to set the UP (User Priority) value.

The previous method of classification depends upon preservation of DSCP value throughout the network, where the DSCP value maps to a particular queue (BE, BK, VI, VO).

However, the DSCP values are not always preserved as this can be viewed as a security risk.

Using port based QoS policies is inadequate for CAPWAP based wireless LAN solutions as all data packets use the same UDP port (CAPWAP = UDP 5246) and the access point uses the outside QoS marking to determine which queue the packets should be placed in.

With TCLAS, DSCP preservation is not a requirement.

Call Admission Control must be enabled on the access point in order to enable TCLAS.

TCLAS will be negotiated within the ADDTS packets, which are used to request bandwidth in order to place or receive a call.

QoS Basic Service Set (QBSS)

There are three different versions of QoS Basic Service Set (QBSS) that the Cisco Wireless IP Phone 8821 and 8821-EX support.

The first version from Cisco was on a 0-100 scale and was not based on clear channel assessment (CCA), so it does not account for channel utilization, but only the 802.11 traffic traversing that individual access point's radio. So it does not account for other 802.11 energy or interferers using the same frequencies.

QBSS is also a part of 802.11e, which is on a 0-255 scale and is CCA based. So this gives a true representation on how busy the channel is. The max threshold is also defined on the client side, which is set to 105.

The second version from Cisco is based on the 802.11e version, but allows the default max threshold of 105 to be optionally configured.

Each version of QBSS can be optionally be configured on the access point.

Wired QoS

Configure QoS settings and policies for the necessary network devices.

Configuring Cisco Switch Ports for WLAN Devices

Configure the Cisco Wireless LAN Controller and Cisco Access Point switch ports as well as any uplink switch ports.

If utilizing Cisco IOS Switches, use the following switch port configurations.

Enable COS trust for Cisco Wireless LAN Controller

```
mls qos
!  
interface X
```

```
mls qos trust cos
```

Enable DSCP trust for Cisco Access Points

```
mls qos
!  
interface X  
mls qos trust dscp
```

If utilizing Cisco Meraki MS Switches, reference the Cisco Meraki MS Switch VoIP Deployment Guide.

https://meraki.cisco.com/lib/pdf/meraki_whitepaper_msvoip.pdf

Note: When using the Cisco Wireless LAN Controller, DSCP trust must be implemented or must trust the UDP data ports used by the Cisco Wireless LAN Controller (CAPWAP = UDP 5246 and 5247) on all interfaces where wireless packets will traverse to ensure QoS markings are correctly set.

Configuring Cisco Switch Ports for Wired IP Phones

Enable the Cisco wired IP phone switch ports for Cisco phone trust.

Below is a sample switch configuration:

```
mls qos
!  
Interface X  
mls qos trust device cisco-phone  
mls qos trust dscp
```

Roaming

The Cisco Wireless IP Phone 8821 and 8821-EX default to Auto for the 802.11 mode, which allows the Cisco Wireless IP Phone 8821 and 8821-EX to connect to either 5 GHz or 2.4 GHz and enables interband roaming support.

802.11r / Fast Transition (FT) is the recommended deployment model for all environment types where frequent roaming occurs.

802.1x authentication is required in order to utilize CCKM.

802.1x without 802.11r (FT) or CCKM can introduce delay during roaming due to its requirement for full re-authentication. WPA and WPA2 introduce additional transient keys and can lengthen roaming time.

When 802.11r (FT) or CCKM is utilized, roaming times can be reduced from 400-500 ms to less than 100 ms, where that transition time from one access point to another will not be audible to the user.

The Cisco Wireless IP Phone 8821 and 8821-EX support 802.11r (FT) with WPA2 (AES) or WPA2-PSK (AES) and CCKM with WPA2 (AES).

Authentication	Roaming Time
-----------------------	---------------------

WPA/WPA2 Personal	150 ms
WPA/WPA2 Enterprise	300 ms
802.11r (FT)	< 100 ms
CCKM	< 100 ms

The Cisco Wireless IP Phone 8821 and 8821-EX manage the scanning and roaming events.

The roaming trigger for the majority of roams should be due to meeting the required RSSI differential based on the current RSSI, which results in seamless roaming (no voice interruptions).

For seamless roaming to occur, the Cisco Wireless IP Phone 8821 and 8821-EX must be associated to an access point for at least 3 seconds, otherwise roams can occur based on packet loss (max tx retransmissions or missed beacons).

Roaming based on RSSI may not occur if the current signal has met the strong RSSI threshold.

Fast Secure Roaming (FSR)

802.11r / Fast Transition (FT) is the recommended deployment model for all environment types where frequent roaming occurs.

Cisco Centralized Key Management (CCKM) is also supported, but requires 802.1x authentication.

802.11r (FT) and CCKM enable fast secure roaming and limits the off-network time to keep audio gaps at a minimum when on call.

802.1x or PSK without 802.11r (FT) and 802.1x without CCKM can introduce delay during roaming due to its requirement for full re-authentication. WPA and WPA2 introduce additional transient keys and can lengthen roaming time.

802.11r (FT) and CCKM centralizes the key management and reduces the number of key exchanges.

When 802.11r (FT) or CCKM is utilized, roaming times can be reduced from 400-500 ms to less than 100 ms, where that transition time from one access point to another will not be audible to the user.

There are two methods of 802.11r (FT) roaming.

Over the Air

The client communicates directly with the target access point using 802.11 authentication with the FT authentication algorithm.

Over the Distribution

The client communicates with the target access point through the current access point. The communication between the client and the target access point is carried in FT action frames between the client and the current access point via the WLAN controller.

802.11r (FT) utilizing the Over the Air method is the recommended fast secure roaming model to deploy.

Since the 802.11r (FT) plus Over the Distribution method requires connectivity to the currently associated access point, this method may not work well if the phone is not always able to communicate with the current access point as well as the target access point, which could occur in non-open environments if line of sight to both the current access point and the target access point can not be retained when a roaming event occurs.

The Cisco Wireless IP Phone 8821 and 8821-EX support 802.11r (FT) with WPA2-PSK or WPA2 and CCKM with WPA2 or WPA.

FSR Type	Authentication	Key Management	Encryption
802.11r (FT)	PSK	WPA2	AES
802.11r (FT)	EAP-FAST	WPA2	AES
802.11r (FT)	EAP-TLS	WPA2	AES
802.11r (FT)	PEAP-GTC	WPA2	AES
802.11r (FT)	PEAP-MSCHAPv2	WPA2	AES
CCKM	EAP-FAST	WPA2, WPA	AES, TKIP
CCKM	EAP-TLS	WPA2, WPA	AES, TKIP
CCKM	PEAP-GTC	WPA2, WPA	AES, TKIP
CCKM	PEAP-MSCHAPv2	WPA2, WPA	AES, TKIP

Note: If deploying the Cisco Wireless IP Phone 8821 or 8821-EX into an environment where other Wi-Fi phone models exist but those Wi-Fi phone models do not support 802.11r (FT), then should be able to use that same pre-existing SSID for the Cisco Wireless IP Phone 8821 or 8821-EX, but is recommended to enable 802.11r (FT) utilizing the Over the Air method on top of the other pre-existing key management types (e.g. 802.1x, CCKM, or 802.1x + CCKM); assuming the other Wi-Fi phone models can interoperate in an 802.11r (FT) enabled network while not utilizing 802.11r (FT).

The access point must support AES as TKIP can only be used as the broadcast/multicast cipher.

Interband Roaming

The Cisco Wireless IP Phone 8821 and 8821-EX default to Auto for the frequency band mode, which enables interband roaming and currently gives preference to the strongest signal. Typically, this will give preference to 2.4 GHz over 5 GHz due to 2.4 GHz having a stronger signal in general assuming the power levels are the same.

At power on, the Cisco Wireless IP Phone 8821 and 8821-EX will scan all 2.4 and 5 GHz channels when in Auto mode, then attempt to associate to an access point for the configured network if available.

If configured for 5 GHz only or 2.4 GHz only mode, then just those channels are scanned.

It is recommended to perform a spectrum analysis to ensure that the desired bands can be enabled in order to perform interband roaming.

Scanning

There are three different scan modes (**Continuous**, **Auto**, **Single AP**), which can be configured for the Cisco Wireless IP Phone 8821 and 8821-EX in the Cisco Unified Communications Manager.

When using multiple access points where seamless roaming is required, **Continuous** (default) or **Auto** scan mode should be enabled (**Single AP** scan mode should not be used if multiple access points exist).

Continuous scan mode is the default scan mode, which enables seamless roaming, but power consumption is higher.

When on an active call with **Continuous** or **Auto** scan mode enabled, the Cisco Wireless IP Phone 8821 and 8821-EX will be continuously scanning regardless of the current call state (idle or on call) or current access point signal level (RSSI).

When in idle (not on an active call) and **Continuous** scan mode is enabled, then the Cisco Wireless IP Phone 8821 and 8821-EX will also be continuously scanning.

When in idle with **Auto** scan mode, scans will only occur when the pre-defined RSSI threshold is held for the pre-defined duration.

Continuous scan mode is recommended for environments where frequent roams occur or where smaller cells (pico cells) exist.

Continuous scan mode can also help with location tracking.

If using only one access point, select **Single AP** mode on the Cisco Wireless IP Phone 8821 and 8821-EX to reduce scanning and optimize battery life.

Power Management

When the access point supports Proxy ARP, the idle battery life will be optimized. Proxy ARP allows the Cisco Wireless IP Phone 8821 and 8821-EX to remain in sleep mode longer versus waking up at each Delivery Traffic Indicator Message (DTIM) period to check for incoming broadcasts.

To optimize battery life, the Cisco Wireless IP Phone 8821 and 8821-EX will utilize either U-APSD or PS-POLL power save methods depending on whether Wi-Fi MultiMedia (WMM) is enabled in the Access Point configuration or not.

If the access point does not support Proxy ARP, then the idle battery life will be up to fifty percent less.

The Cisco Wireless IP Phone 8821 and 8821-EX primarily use U-APSD when in idle or on call.

Null Power Save (PS-NUL) frames are utilized for off-channel scanning.

Wireless LAN is automatically disabled temporarily when Ethernet is connected by docking the Cisco Wireless IP Phone 8821 or 8821-EX when a USB to Ethernet dongle is attached, but will be automatically re-enabled once Ethernet is disconnected.

Use of a supported USB to Ethernet dongle is for initial provisioning purposes only and not to convert the Cisco Wireless IP Phone 8821 or 8821-EX to a wired IP phone.

Delivery Traffic Indicator Message (DTIM)

The Cisco Wireless IP Phone 8821 and 8821-EX can use the DTIM period to schedule wakeup periods to check for broadcast and multicast packets as well as any unicast packets.

If Proxy ARP is enabled, then the Cisco Wireless IP Phone 8821 and 8821-EX do not have to wake up at DTIM.

For optimal battery life and performance, is recommended to set the DTIM period to **2** with a beacon period of **100 ms**.

The DTIM period is a tradeoff between battery life and multicast performance.

Broadcast and multicast traffic will be queued until the DTIM period when there are power save enabled clients associated to the access point, so DTIM will determine how quickly these packets can be delivered to the client. If using multicast applications, a shorter DTIM period can be used.

When multiple multicast streams exist on the wireless LAN frequently, then it is recommended to set the DTIM period to **1**.

Dynamic Transmit Power Control (DTPC)

To ensure packets are exchanged successfully between the Cisco Wireless IP Phone 8821 or 8821-EX and the access point, Dynamic Transmit Power Control (DTPC) should be enabled.

DTPC prevents one-way audio when RF traffic is heard in one direction only.

If the access point does not support DTPC, then the Cisco Wireless IP Phone 8821 and 8821-EX will use the highest available transmit power depending on the current channel and data rate.

The access point's radio transmit power should not have a transmit power greater than what the Cisco Wireless IP Phone 8821 and 8821-EX can support.

Call Capacity

Design the network to accommodate the desired call capacity.

The Cisco access point can support up to 27 bi-directional voice streams for both 802.11a/n/ac and 802.11g/n at a data rate of 24 Mbps or higher. To achieve this capacity, there must be minimal wireless LAN background traffic and initial radio frequency (RF) utilization.

The number of calls may vary depending on the data rate, initial channel utilization, and the environment.

Audio Calls

Below lists the maximum number of audio calls (single bi-directional voice stream) supported per access point / channel.

Max # of Streams	Audio Codec	Audio Bit Rate	802.11 Mode	Data Rate
13	G.722 / G.711	64 Kbps	802.11a/n or 802.11g/n + Bluetooth Disabled	6 Mbps
20	G.722 / G.711	64 Kbps	802.11a/n or 802.11g/n + Bluetooth Disabled	12 Mbps
27	G.722 / G.711	64 Kbps	802.11a/n/ac or 802.11g/n + Bluetooth Disabled	24 Mbps or higher

Multicast

When enabling multicast in the wireless LAN, performance and capacity must be considered.

If there is an associated client that is in power save mode, then all multicast packets will be queued until the DTIM period.

With multicast, there is no guarantee that the packet will be received by the client.

The multicast traffic will be sent at the highest mandatory / basic data rate enabled on the access point, so will want to ensure that only the lowest enabled rate is configured as the only mandatory / basic rate.

The client will send the IGMP join request to receive that multicast stream. The client will send the IGMP leave when the session is to be ended.

The Cisco Wireless IP Phone 8821 and 8821-EX support the IGMP query feature, which can be used to reduce the amount of multicast traffic on the wireless LAN when not necessary.

Ensure that IGMP snooping is also enabled on all switches.

Note: If using Coexistence where 802.11b/g/n and Bluetooth are being used simultaneously, then multicast voice is not supported.

Configuring the Cisco Wireless LAN

Cisco Wireless LAN Controller and Lightweight Access Points

When configuring the Cisco Wireless LAN Controller and Lightweight Access Points, use the following guidelines:

- Ensure **802.11r (FT) or CCKM** is **Enabled**
- Set **Quality of Service (QoS)** to **Platinum**
- Set the **WMM Policy** to **Required**
- Ensure **Session Timeout** is enabled and configured correctly
- Ensure **Broadcast Key Interval** is enabled and configured correctly
- Ensure **Aironet IE** is **Enabled**
- Set **DTPC Support** to **Enabled**
- Disable **P2P (Peer to Peer) Blocking Action**
- Ensure **Client Exclusion** is configured correctly
- Disable **DHCP Address Assignment Required**
- Set **MFP Client Protection** to **Optional** or **Disabled**
- Set the **DTIM Period** to **2**
- Set **Client Load Balancing** to **Disabled**
- Set **Client Band Select** to **Disabled**
- Set **IGMP Snooping** to **Enabled**
- Enable **Symmetric Mobile Tunneling Mode** if Layer 3 mobility is utilized
- Enable **ClientLink** if utilizing Cisco 802.11n capable Access Points
- Configure the **Data Rates** as necessary
- Enable **CCX Location Measurement**
- Configure **Auto RF** as necessary
- Set **Admission Control Mandatory** to **Enabled** for **Voice**
- Set **Load Based CAC** to **Enabled** for **Voice**
- Enable **Traffic Stream Metrics** for **Voice**
- Set **Admission Control Mandatory** to **Disabled** for **Video**
- Set **EDCA Profile** to **Voice Optimized** or **Voice and Video Optimized**
- Set **Enable Low Latency MAC** to **Disabled**
- Ensure that **Power Constraint** is **Disabled**
- Enable **Channel Announcement** and **Channel Quiet Mode**
- Configure the **High Throughput Data Rates** as necessary
- Configure the **Frame Aggregation** settings
- Enable **CleanAir** if utilizing Cisco access points with CleanAir technology
- Configure **Multicast Direct Feature** as necessary
- Set the **802.1p tag** to **5** for the **Platinum** QoS profile

802.11 Network Settings

It is recommended to have the Cisco Wireless IP Phone 8821 and 8821-EX operate on the 5 GHz band only due to have many channels available and not as many interferers as the 2.4 GHz band has.

If wanting to use 5 GHz, ensure the 802.11a/n/ac network status is **Enabled**.

Set the **Beacon Period** to **100 ms**.

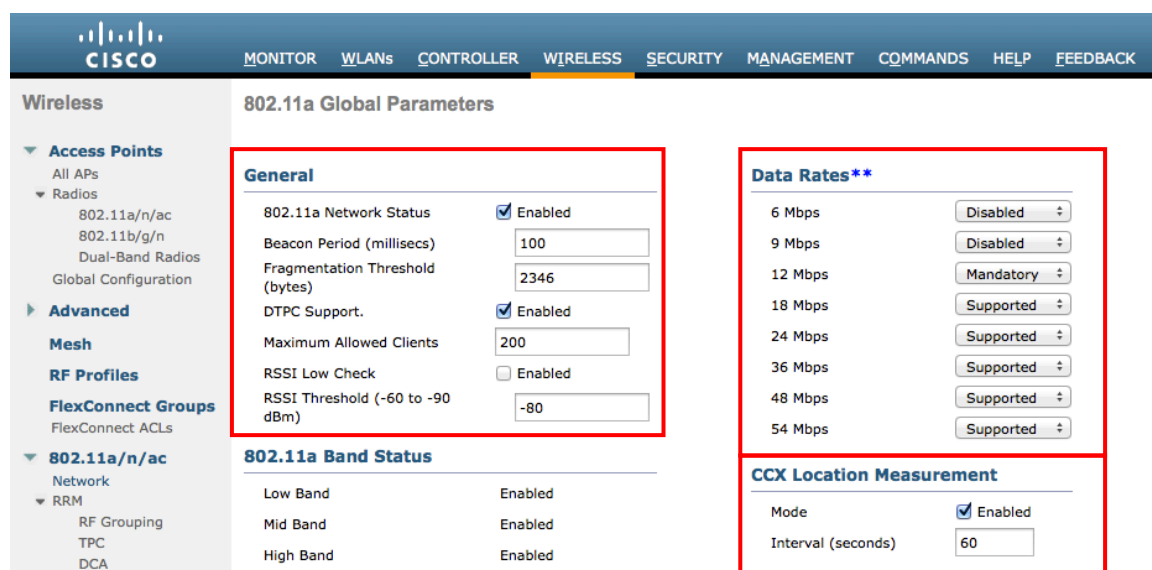

Ensure **DTPC Support** is enabled.

If using Cisco 802.11n capable Access Points, ensure **ClientLink** is enabled.

With the current releases, **Maximum Allowed Clients** can be configured.

Recommended to set 12 Mbps as the mandatory (basic) rate and 18 Mbps and higher as supported (optional) rates; however some environments may require 6 Mbps to be enabled as a mandatory (basic) rate.

Enable **CCX Location Measurement**.

The screenshot displays the Cisco Wireless LAN Controller configuration interface for 802.11a Global Parameters. The interface is divided into three main sections, each highlighted with a red border:

- General:** Contains settings for 802.11a Network Status (Enabled), Beacon Period (100), Fragmentation Threshold (2346), DTPC Support (Enabled), Maximum Allowed Clients (200), RSSI Low Check (Disabled), and RSSI Threshold (-80).
- Data Rates**:** Lists data rates from 6 Mbps to 54 Mbps with their status: 6 Mbps (Disabled), 9 Mbps (Disabled), 12 Mbps (Mandatory), 18 Mbps (Supported), 24 Mbps (Supported), 36 Mbps (Supported), 48 Mbps (Supported), and 54 Mbps (Supported).
- CCX Location Measurement:** Shows Mode (Enabled) and Interval (60 seconds).

If wanting to use 2.4 GHz, ensure the 802.11b/g/n network status and 802.11g is enabled.

Set the **Beacon Period** to **100 ms**.

Short Preamble should be **Enabled** in the 2.4 GHz radio configuration setting on the access point when no legacy clients that require a long preamble are present in the wireless LAN. By using the short preamble instead of long preamble, the wireless network performance is improved.

Ensure **DTPC Support** is enabled.

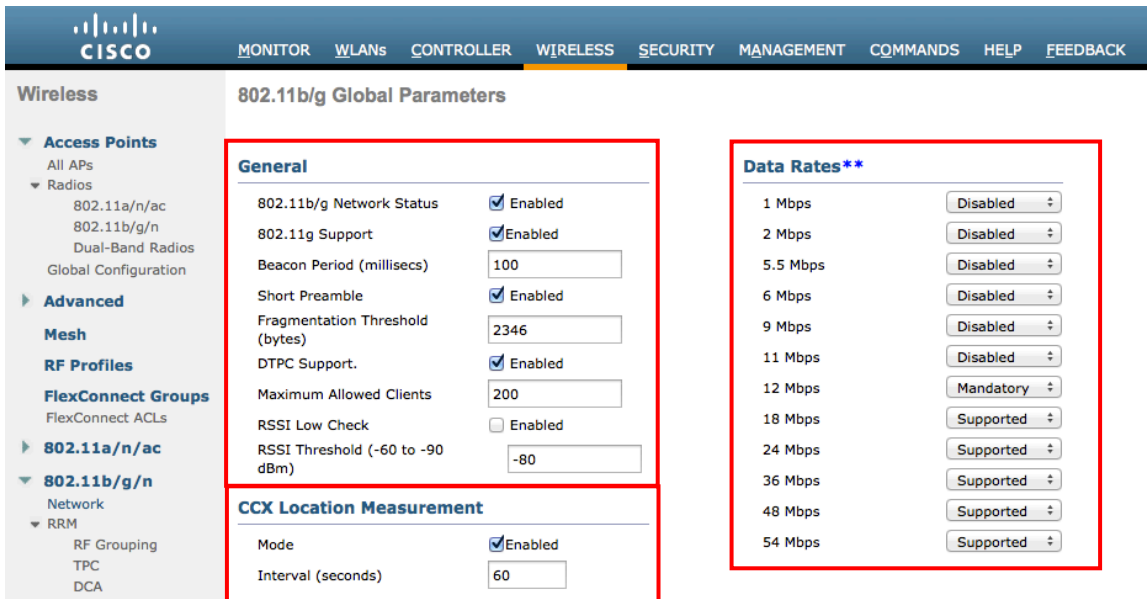

If using Cisco 802.11n capable Access Points, ensure **ClientLink** is enabled.

With the current releases, **Maximum Allowed Clients** can be configured.

Recommended to set 12 Mbps as the mandatory (basic) rate and 18 Mbps and higher as supported (optional) rates assuming that there will not be any 802.11b only clients that will connect to the wireless LAN; however some environments may require 6 Mbps to be enabled as a mandatory (basic) rate.

If 802.11b clients exist, then 11 Mbps should be set as the mandatory (basic) rate and 12 Mbps and higher as supported (optional).

Enable **CCX Location Measurement**.

Beamforming (ClientLink)

Enable **ClientLink** if using Cisco 802.11n capable Access Points.

For releases prior to 7.2.103.0, **ClientLink** can be enabled globally via the 802.11 Global Parameters section or on individual access points via the access point's 802.11 radio configuration page.

As of release 7.2.103.0, **ClientLink** is no longer configurable via the Cisco Wireless LAN Controller's web interface and is only configurable via command line.

With releases 7.2.103.0 and later use the following commands to enable the beamforming feature globally for all access points or for individual access point radios.

```
(Cisco Controller) >config 802.11a beamforming global enable
(Cisco Controller) >config 802.11a beamforming ap <ap_name> enable
(Cisco Controller) >config 802.11b beamforming global enable
(Cisco Controller) >config 802.11b beamforming ap <ap_name> enable
```

The current status of the beamforming feature can be displayed by using the following command.

```
(Cisco Controller) >show 802.11a
(Cisco Controller) >show 802.11b
```

Legacy Tx Beamforming setting..... **Enabled**

[Performance Profile](#)

Note: Changing any of the parameters causes the Radio to be and thus may result in loss of connectivity for some clients.

Auto RF (RRM)

When using the Cisco Wireless LAN Controller it is recommended to enable Auto RF to manage the channel and transmit power settings.

Configure the access point transmit power level assignment method for either 5 or 2.4 GHz depending on which frequency band is to be utilized.

If using automatic power level assignment, a maximum and minimum power level can be specified.

Wireless | 802.11a > RRM > Tx Power Control (TPC)

TPC Version

Interference Optimal Mode (TPCv2)

Coverage Optimal Mode (TPCv1)

Tx Power Level Assignment Algorithm

Power Level Assignment Method	Automatic	Every 600 sec
	On Demand	Invoke Power Update Once
	Fixed	1
Maximum Power Level Assignment (-10 to 30 dBm)	17	
Minimum Power Level Assignment (-10 to 30 dBm)	11	
Power Assignment Leader	WLC5508-1 (10.81.6.69)	
Last Power Level Assignment	20 secs ago	
Power Threshold (-80 to -50 dBm)	-65	
Power Neighbor Count	3	

If using 5 GHz, it is recommended to enable up to 12 channels only to avoid any potential delay of access point discovery due to having to scan many channels.

The 5 GHz channel width can be configured for 20 MHz or 40 MHz if using Cisco 802.11n Access Points and 20 MHz, 40 MHz, or 80 MHz if using Cisco 802.11ac Access Points.

It is recommended to utilize the same channel width for all access points.

The screenshot shows the Cisco Wireless LAN Controller configuration interface. The main navigation bar includes MONITOR, WLANs, CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, COMMANDS, HELP, and FEEDBACK. The left sidebar shows the configuration tree with 'Wireless' selected. The main content area is titled '802.11a > RRM > Dynamic Channel Assignment (DCA)'. Under the 'Dynamic Channel Assignment Algorithm' section, the following settings are visible:

- Channel Assignment Method: Automatic, Interval: 10 minutes, AnchorTime: 0
- Freeze, OFF
- Invoke Channel Update Once (button)
- Avoid Foreign AP interference: Enabled
- Avoid Cisco AP load: Enabled
- Avoid non-802.11a noise: Enabled
- Avoid Persistent Non-WiFi Interference: Enabled
- Channel Assignment Leader: WLC5508-1 (10.81.6.69)
- Last Auto Channel Assignment: 401 secs ago
- DCA Channel Sensitivity: Medium, STARTUP (5 dB)
- Channel Width: 20 MHz, 40 MHz, 80 MHz
- Avoid check for non-DFS channel: Enabled

The 'DCA Channel List' section is highlighted with a red box and contains the following list of channels:

```
DCA Channels: 36, 40, 44, 48, 52, 56, 60, 64, 149, 153, 157, 161
```

If using 2.4 GHz, only channels 1, 6, and 11 should be enabled in the DCA list.

It is recommended to configure the 2.4 GHz channel for 20 MHz even if using Cisco 802.11n Access Points capable of 40 MHz due to the limited number of channels available in 2.4 GHz.

The screenshot displays the Cisco Wireless LAN Controller configuration interface for Dynamic Channel Assignment (DCA). The main navigation bar includes 'MONITOR', 'WLANs', 'CONTROLLER', 'WIRELESS', 'SECURITY', 'MANAGEMENT', 'COMMANDS', 'HELP', and 'FEEDBACK'. The left sidebar shows the 'Wireless' menu with options for 'Access Points', 'Radios', 'Advanced', 'Mesh', 'RF Profiles', 'FlexConnect Groups', and '802.11a/n/ac'. The main content area is titled '802.11b > RRM > Dynamic Channel Assignment (DCA)'. Under the 'Dynamic Channel Assignment Algorithm' section, the 'Channel Assignment Method' is set to 'Automatic', with 'Interval' at '10 minutes' and 'AnchorTime' at '0'. A button labeled 'Invoke Channel Update Once' is visible. Other settings include 'Avoid Foreign AP interference' (Enabled), 'Avoid Cisco AP load' (Enabled), 'Avoid non-802.11b noise' (Enabled), and 'Avoid Persistent Non-WiFi Interference' (Enabled). The 'Channel Assignment Leader' is 'WLC5508-1 (10.81.6.69)' and the 'Last Auto Channel Assignment' was '482 secs ago'. The 'DCA Channel Sensitivity' is set to 'Medium' with a 'STARTUP (5 dB)' note. A 'DCA Channel List' is shown with the channels '1, 6, 11' selected, and the 'DCA Channels' field is highlighted with a red box.

Individual access points can be configured to override the global setting to use dynamic channel and transmit power assignment for either 5 or 2.4 GHz depending on which frequency band is to be utilized.

Other access points enabled can be enabled for Auto RF and workaround the access points that are statically configured.

This may be necessary if there is an intermittent interferer present in an area.

The 5 GHz channel width can be configured for 20 MHz or 40 MHz if using Cisco 802.11n Access Points and 20 MHz, 40 MHz, or 80 MHz if using Cisco 802.11ac Access Points.

It is recommended to use channel bonding only if using 5 GHz.

It is recommended to utilize the same channel width for all access points.

[Performance Profile](#)

Note: Changing any of the parameters causes the Radio to be and thus may result in loss of connectivity for some clients.

Client Roaming

The Cisco Wireless IP Phone 8821 and 8821-EX do not utilize the RF parameters in the Client Roaming section of the Cisco Wireless LAN Controller as scanning and roaming is managed independently by the phone itself.

EDCA Parameters

Set the EDCA profile for **Voice Optimized** and disable **Low Latency MAC** for either 5 or 2.4 GHz depending on which frequency band is to be utilized.

Low Latency MAC (LLM) reduces the number of retransmissions to 2-3 per packet depending on the access point platform, so it can cause issues if multiple data rates are enabled.

LLM is not supported on the Cisco 802.11n/ac Access Points.

Wireless 802.11a/n Cisco APs > Configure

General

EDCA Profile	Voice & Video Optimized
Enable Low Latency MAC	<input type="checkbox"/>

*Turn this ON only if DSCP marking is correct for media (RTP) and signaling packets.
Low latency Mac feature is not supported for 1140/1250/3500 platforms if more than 3 data rates are enabled.*

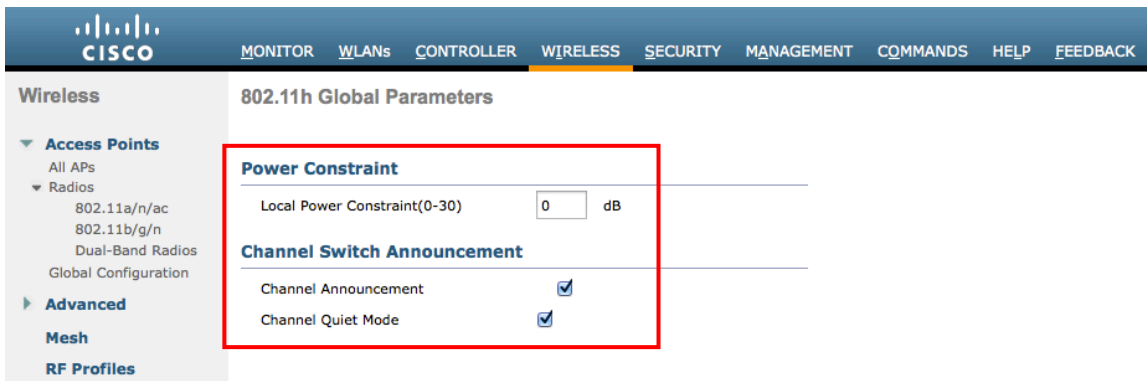

DFS (802.11h)

In the DFS (802.11h) configuration, channel announcement and quiet mode should be enabled.

Power Constraint should be left un-configured or set to 0 dB as DTPC will be used by the Cisco Wireless IP Phone 8821 and 8821-EX to control the transmission power.

In later versions of the Cisco Wireless LAN Controller it does not allow both TPC (Power Constraint) and DTPC (Dynamic Transmit Power Control) to be enabled simultaneously.

Channel Announcement and **Channel Quiet Mode** should be enabled.

The screenshot displays the Cisco Wireless LAN Controller configuration interface. The top navigation bar includes 'MONITOR', 'WLANs', 'CONTROLLER', 'WIRELESS', 'SECURITY', 'MANAGEMENT', 'COMMANDS', 'HELP', and 'FEEDBACK'. The left sidebar shows the 'Wireless' menu with options for 'Access Points', 'Radios', 'Advanced', 'Mesh', and 'RF Profiles'. The main content area is titled '802.11h Global Parameters' and contains two sections: 'Power Constraint' and 'Channel Switch Announcement'. The 'Power Constraint' section has a text input field set to '0' followed by 'dB'. The 'Channel Switch Announcement' section has two checkboxes: 'Channel Announcement' and 'Channel Quiet Mode', both of which are checked.

High Throughput (802.11n/ac)

The 802.11n data rates can be configured per radio (2.4 GHz and 5 GHz).

802.11ac data rates are applicable to 5 GHz only.

Ensure that **WMM** is enabled and **WPA2(AES)** is configured in order to utilize 802.11n/ac data rates.

The Cisco Wireless IP Phone 8821 and 8821-EX support HT MCS 0 - MCS 7 and VHT MCS 0 - MCS 9 data rates only, but higher MCS rates can optionally be enabled if there are other 802.11n/ac clients utilizing the same band frequency that include MIMO antenna technology, which can take advantage of those higher data rates.

It is recommended to disable MCS 0.

Frame Aggregation

Frame aggregation is a process of packaging multiple MAC Protocol Data Units (MPDUs) or MAC Service Data Units (MSDUs) together to reduce the overheads where in turn throughput and capacity can be optimized. Aggregation of MAC Protocol Data Unit (A-MPDU) requires the use of block acknowledgements.

It is required to adjust the A-MPDU and A-MSDU settings to the following to optimize the experience with the Cisco Wireless IP Phone 8821 and 8821-EX.

A-MSDU

User Priority 1, 2 = Enabled
User Priority 0, 3, 4, 5, 6, 7 = Disabled

A-MPDU

User Priority 0, 3, 4, 5 = Enabled
User Priority 1, 2, 6, 7 = Disabled

In the 7.0.116.0 release for the Cisco Wireless LAN Controller, the default A-MPDU and A-MSDU configuration is the following.

A-MSDU

User Priority 0, 1, 2, 3, 4, 5 = Enabled
User Priority 6, 7 = Disabled

A-MPDU

User Priority 0, 4, 5 = Enabled
User Priority 1, 2, 3, 6, 7 = Disabled

Use the following commands to configure the A-MPDU and A-MSDU settings per the Cisco Wireless IP Phone 8821 and 8821-EX requirements.

In order to configure the 5 GHz settings, the 802.11a network will need to be disabled first, then re-enabled after the changes are complete.

```
config 802.11a 11nSupport a-msdu tx priority 1 enable
config 802.11a 11nSupport a-msdu tx priority 2 enable
config 802.11a 11nSupport a-msdu tx priority 0 disable
config 802.11a 11nSupport a-msdu tx priority 3 disable
config 802.11a 11nSupport a-msdu tx priority 4 disable
config 802.11a 11nSupport a-msdu tx priority 5 disable
config 802.11a 11nSupport a-msdu tx priority 6 disable
config 802.11a 11nSupport a-msdu tx priority 7 disable
```

```
config 802.11a 11nSupport a-mpdu tx priority 0 enable
config 802.11a 11nSupport a-mpdu tx priority 3 enable
config 802.11a 11nSupport a-mpdu tx priority 4 enable
config 802.11a 11nSupport a-mpdu tx priority 5 enable
config 802.11a 11nSupport a-mpdu tx priority 1 disable
config 802.11a 11nSupport a-mpdu tx priority 2 disable
config 802.11a 11nSupport a-mpdu tx priority 6 disable
config 802.11a 11nSupport a-mpdu tx priority 7 disable
```

In order to configure the 2.4 GHz settings, the 802.11b/g network will need to be disabled first, then re-enabled after the changes are complete.

```
config 802.11b 11nSupport a-msdu tx priority 1 enable
config 802.11b 11nSupport a-msdu tx priority 2 enable
config 802.11b 11nSupport a-msdu tx priority 0 disable
config 802.11b 11nSupport a-msdu tx priority 3 disable
config 802.11b 11nSupport a-msdu tx priority 4 disable
config 802.11b 11nSupport a-msdu tx priority 5 disable
config 802.11b 11nSupport a-msdu tx priority 6 disable
config 802.11b 11nSupport a-msdu tx priority 7 disable
```

```
config 802.11b 11nSupport a-mpdu tx priority 0 enable
config 802.11b 11nSupport a-mpdu tx priority 3 enable
config 802.11b 11nSupport a-mpdu tx priority 4 enable
config 802.11b 11nSupport a-mpdu tx priority 5 enable
config 802.11b 11nSupport a-mpdu tx priority 1 disable
config 802.11b 11nSupport a-mpdu tx priority 2 disable
config 802.11b 11nSupport a-mpdu tx priority 6 disable
config 802.11b 11nSupport a-mpdu tx priority 7 disable
```

To view the current A-MPDU and A-MSDU configuration, enter either **show 802.11a** for 5 GHz or **show 802.11b** for 2.4 GHz.

[Performance Profile](#)

Note: Changing any of the parameters causes the Radio to be and thus may result in loss of connectivity for some clients.

Rx Sop Threshold

It is recommended to use the default value (**Auto**) for **Rx Sop Threshold**.

The screenshot shows the Cisco Wireless configuration interface. The top navigation bar includes MONITOR, WLANs, CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, COMMANDS, HELP, and FEEDBACK. The left sidebar shows the configuration tree with 'Rx Sop Threshold' selected under 'Advanced'. The main content area displays two dropdown menus for 'Rx Sop Threshold 802.11a' and 'Rx Sop Threshold 802.11b', both set to 'Auto'. A note below states: 'Rx sop only supported in Local, Flex, Bridge and Flex+Bridge mode Aps.'

WLAN Settings

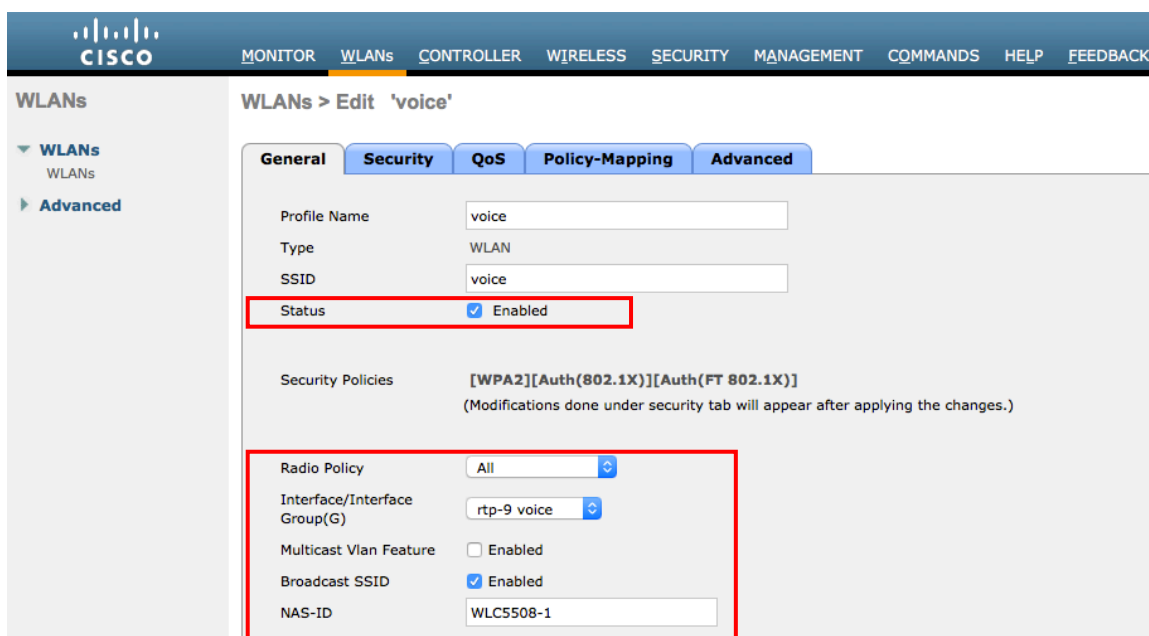

It is recommended to have a separate SSID for the Cisco Wireless IP Phone 8821 and 8821-EX.

However, if there is an existing SSID configured to support voice capable Cisco Wireless LAN endpoints already, then that WLAN can be utilized instead.

The SSID to be used by the Cisco Wireless IP Phone 8821 and 8821-EX can be configured to only apply to a certain 802.11 radio type (e.g. 802.11a only).

It is recommended to have the Cisco Wireless IP Phone 8821 and 8821-EX operate on the 5 GHz band only due to have many channels available and not as many interferers as the 2.4 GHz band has.

Ensure that the selected SSID is not utilized by any other wireless LANs as that could lead to failures when powering on or during roaming; especially if a different security type is utilized.

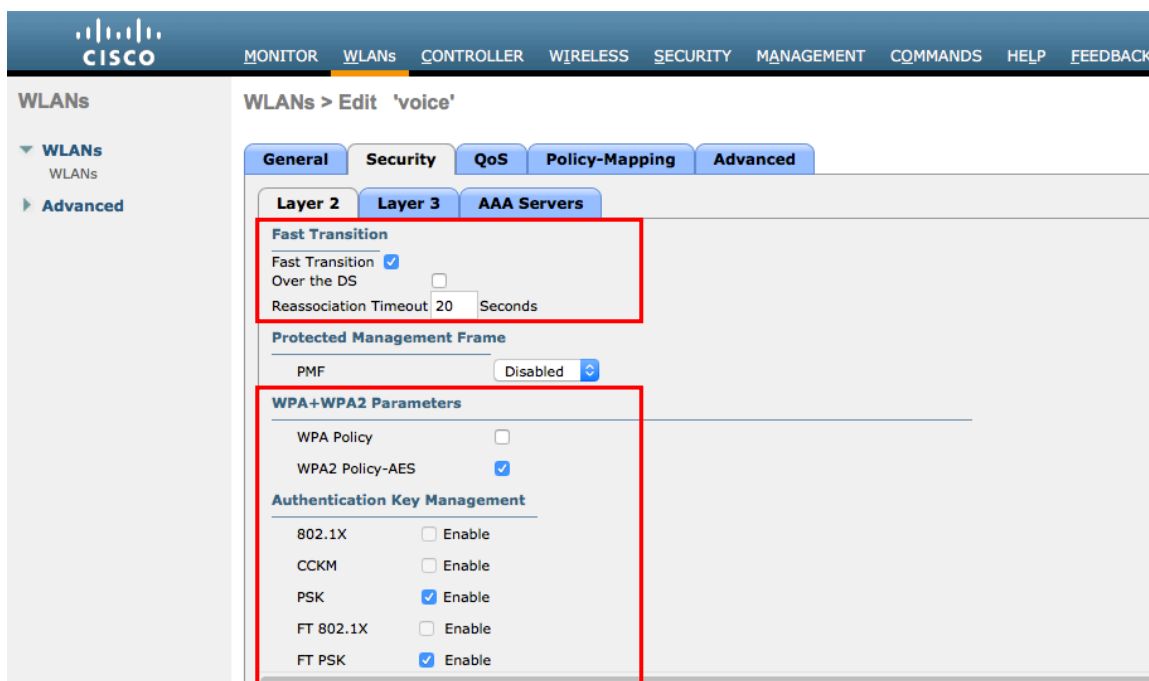

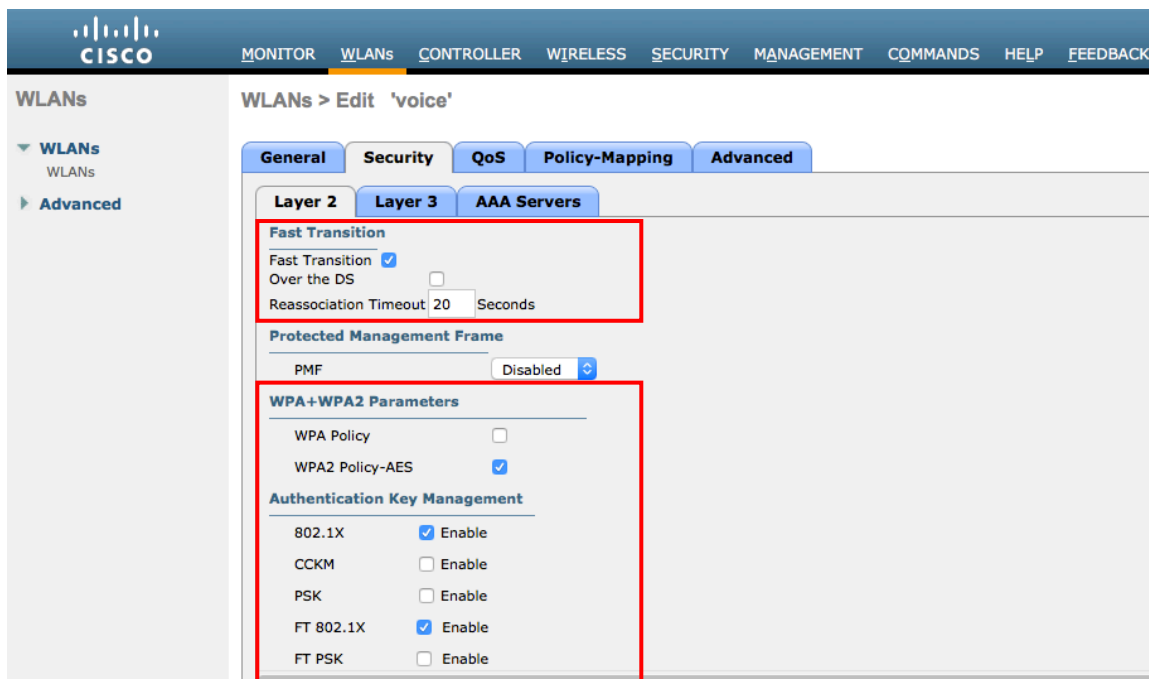

The screenshot shows the Cisco WLAN configuration interface for a profile named 'voice'. The top navigation bar includes MONITOR, WLANs, CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, COMMANDS, HELP, and FEEDBACK. The left sidebar shows the configuration tree with 'WLANs' selected. The main content area displays the 'WLANs > Edit 'voice'' configuration page. The 'General' tab is active, showing fields for Profile Name (voice), Type (WLAN), and SSID (voice). The 'Status' field is checked and labeled 'Enabled'. The 'Security Policies' field shows '[WPA2][Auth(802.1X)][Auth(FT 802.1X)]'. The 'Radio Policy' field is set to 'All'. The 'Interface/Interface Group(G)' field is set to 'rtp-9 voice'. The 'Multicast Vlan Feature' field is unchecked. The 'Broadcast SSID' field is checked and labeled 'Enabled'. The 'NAS-ID' field is set to 'WLC5508-1'.

To utilize 802.11r (FT) for fast secure roaming, check the box to enable Fast Transition.

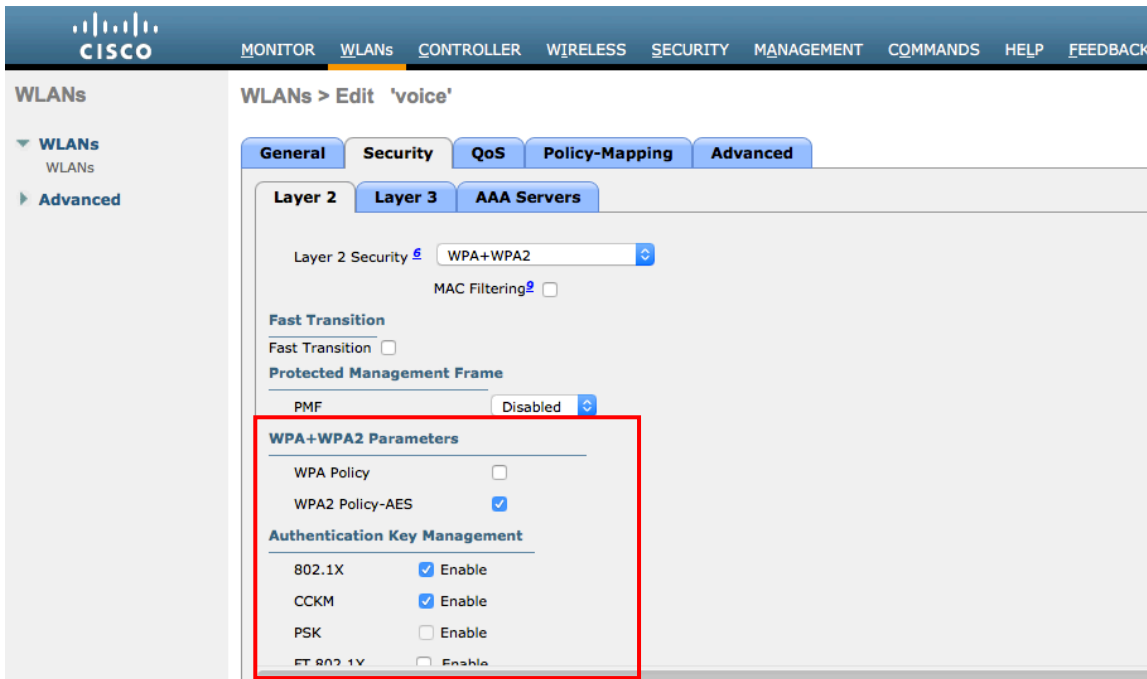

Is recommended to uncheck **Over the DS** to utilize the Over the Air method instead of the Over the Distribution System method.

Enable WPA2 policy with AES encryption then either FT 802.1x or FT PSK for authenticated key management type depending on whether 802.1x or PSK is to be utilized.

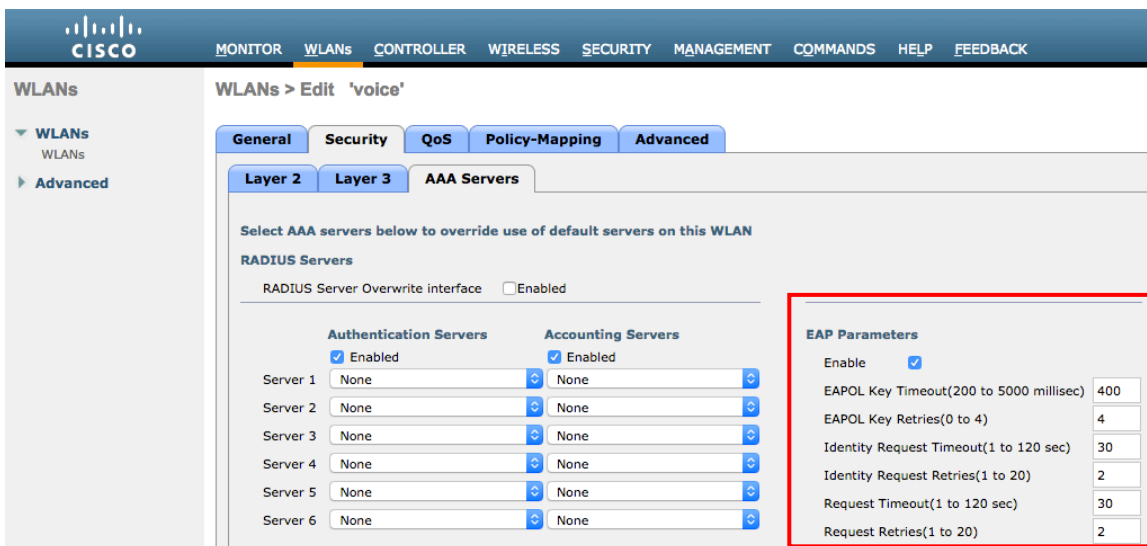

802.1x, CCKM and/or PSK may also be enabled if wanting to utilize the same SSID for various type of voice clients, where some clients do not support 802.11r (FT) depending on whether 802.1x or PSK is being utilized.

To utilize CCKM for fast secure roaming, enable WPA2 policy with AES encryption and 802.1x + CCKM for authenticated key management type.

All EAP parameters can be configured at a per SSID level or at the global level, except for the EAP-Broadcast Key Interval, which can only be configured at the global level.

If wanting to configure the EAP parameters at the per SSID level, check **Enable** in the EAP Parameters section and enter the desired values.

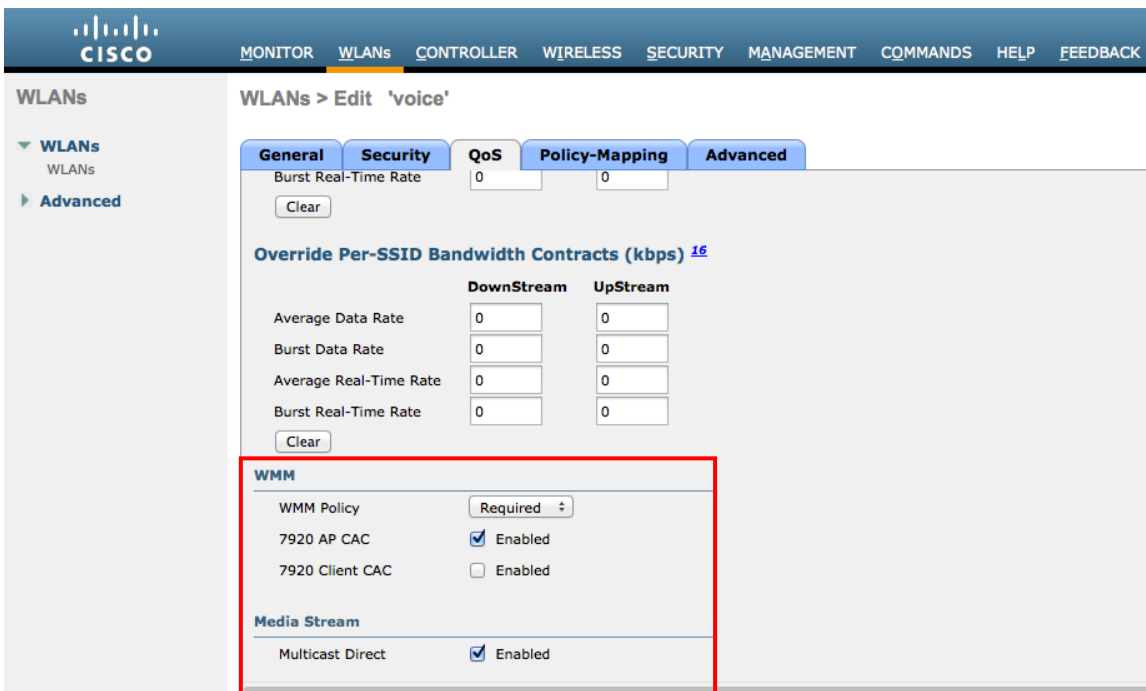

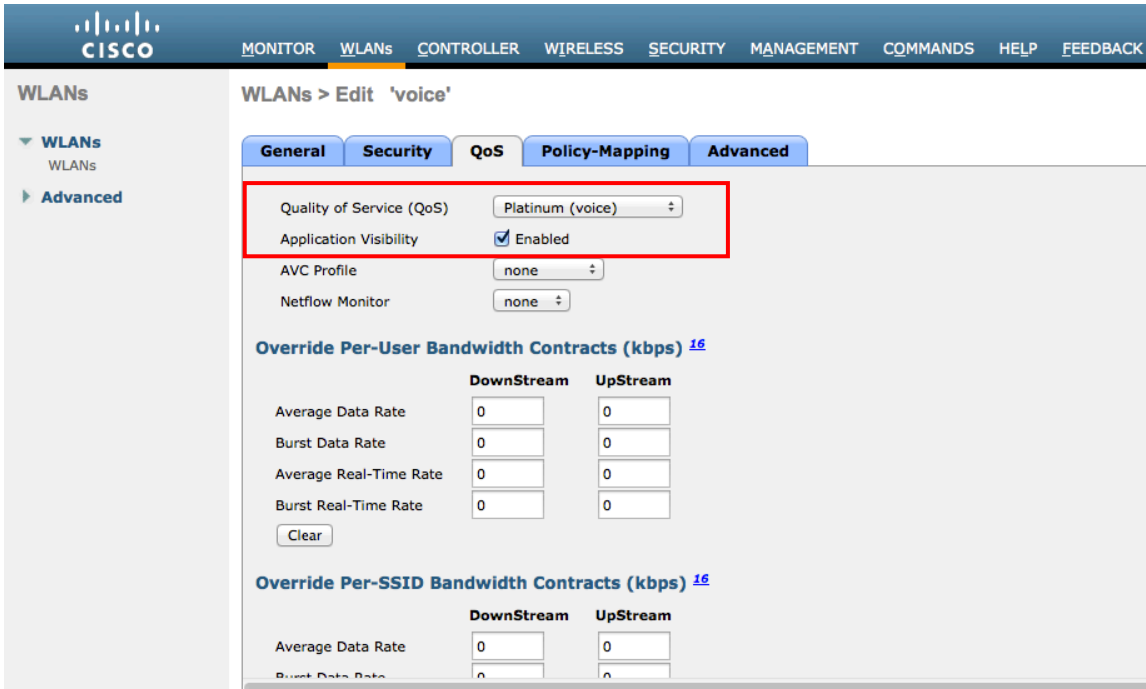

The WMM policy should be set to **Required** only if the Cisco Wireless IP Phone 8821 and 8821-EX or other WMM enabled phones will be using this SSID.

If there are non-WMM clients existing in the WLAN, it is recommended to put those clients on another WLAN.

If non-other WMM clients must utilize the same SSID as the Cisco Wireless IP Phone 8821 and 8821-EX, then ensure the WMM policy is set to **Allowed**.

Enabling WMM will enable the 802.11e version of QoS. There are also the **7920 Client CAC** and **7920 AP CAC** options, where **7920 Client CAC** will enable Cisco version 1 and **7920 AP CAC** enables Cisco version 2.

Configure **Enable Session Timeout** as necessary per your requirements. It is recommended to either disable the session timeout or extend the timeout (e.g. 24 hours / 86400 seconds) to avoid possible interruptions during audio calls. If disabled it

will avoid any potential interruptions altogether, but enabling session timeout can help to re-validate client credentials periodically to ensure that the client is using valid credentials.

Enable Aironet Extensions (**Aironet IE**).

Peer to Peer (P2P) Blocking Action should be disabled.

Configure **Client Exclusion** as necessary.

The **Maximum Allowed Clients Per AP Radio** can be configured as necessary.

Off Channel Scanning Defer can be tuned to defer scanning for certain queues as well as the scan defer time.

If using best effort applications frequently or if DSCP values for priority applications (e.g. voice and call control) are not preserved to the access point, then is recommended to enable the lower priority queues (0-3) along with the higher priority queues (4-6) to defer off channel scanning as well as potentially increasing the scan defer time.

For deployments where EAP failures occur frequently, it is recommended to enable priority queue 7 to defer off channel scanning during EAP exchanges.

DHCP Address Assignment Required should be disabled.

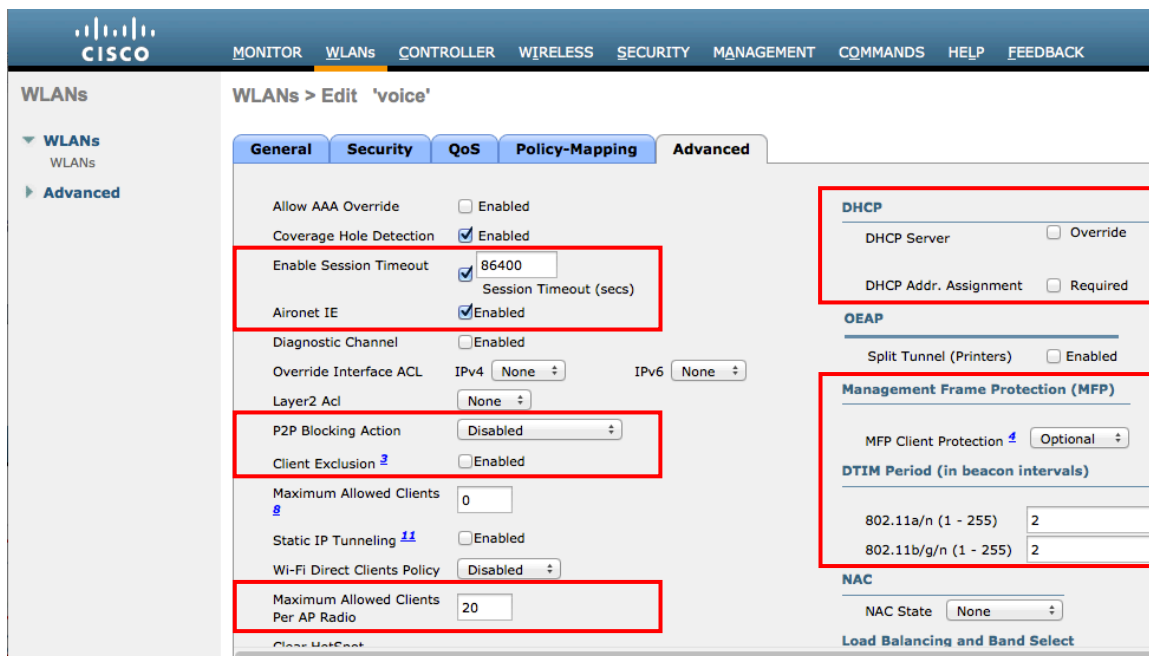

Management Frame Protection should be set to **Optional** or **Disabled**.

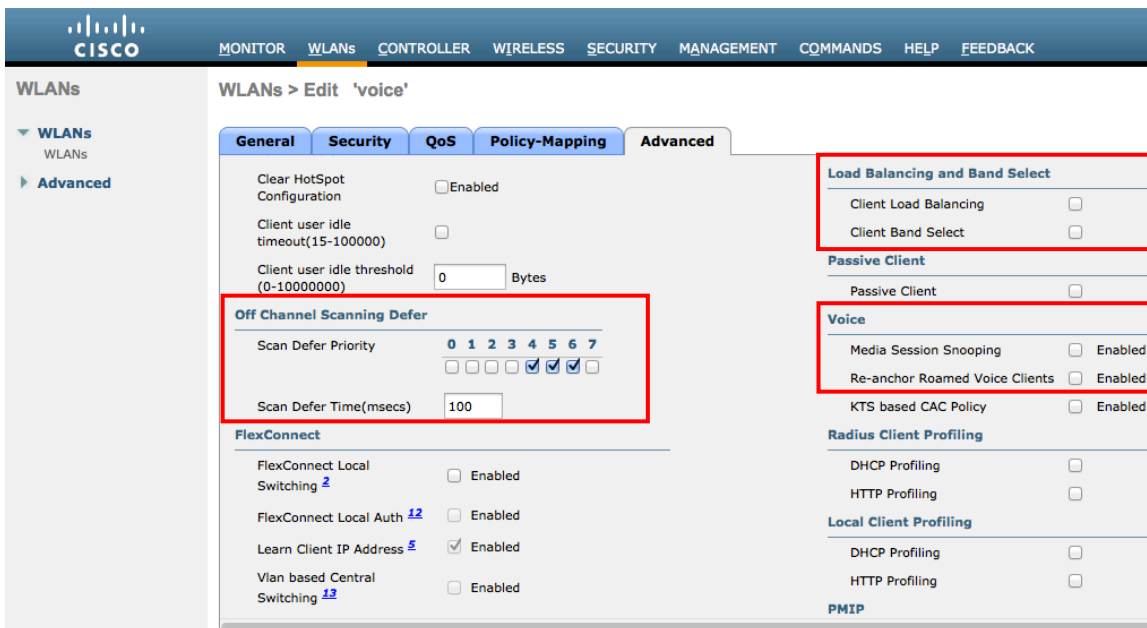

Use a **DTIM Period** of **2** with a beacon period of **100 ms**.

Ensure **Client Load Balancing** and **Client Band Select** are disabled.

Media Session Snooping can be enabled to utilize SIP CAC.

It is recommended to set **Re-anchor Roamed Voice Clients** to disabled as this can cause brief interruptions with wireless LAN connectivity when a call is terminated after performing an inter-controller roaming.

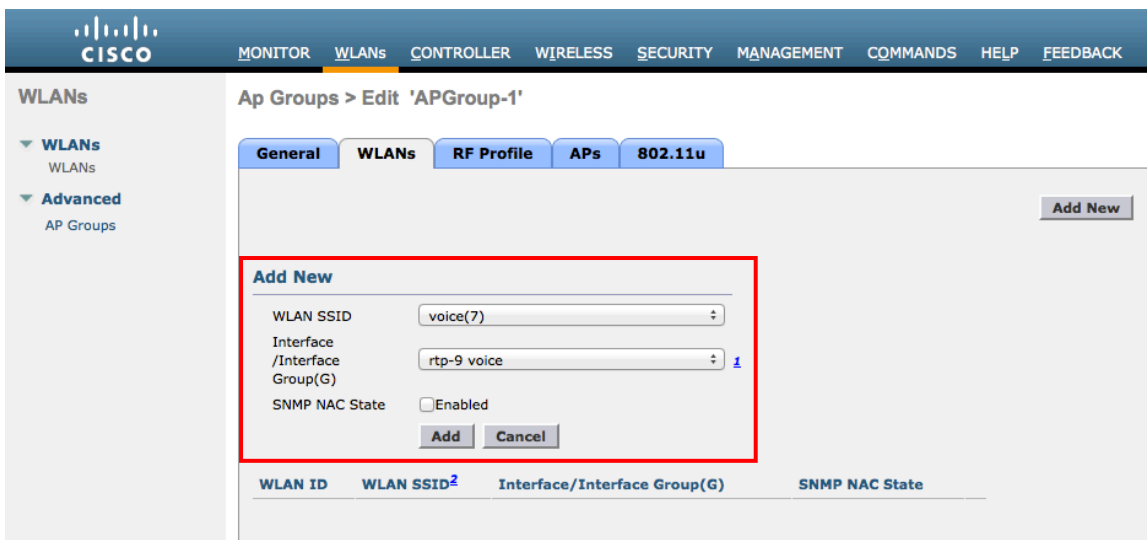

AP Groups

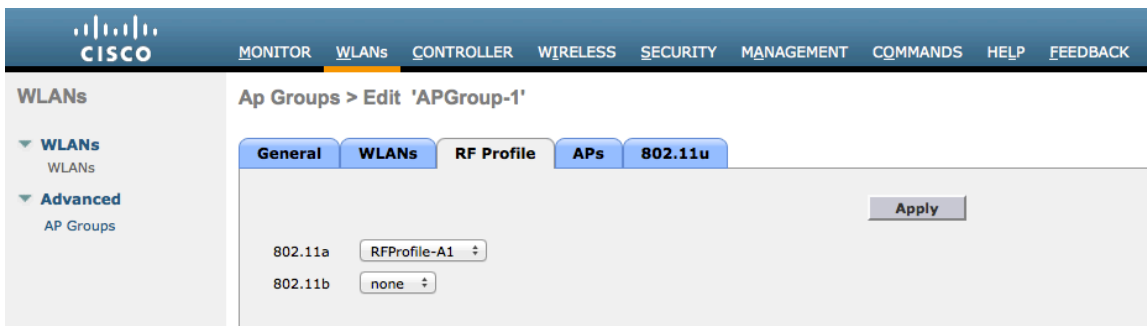

AP Groups can be created to specify which WLANs / SSIDs are to be enabled and which interface they should be mapped to as well as what RF Profile parameters should be used for the access points assigned to the AP Group.

On the **WLANs** tab, select the desired SSIDs and interfaces to map to then select **Add**.

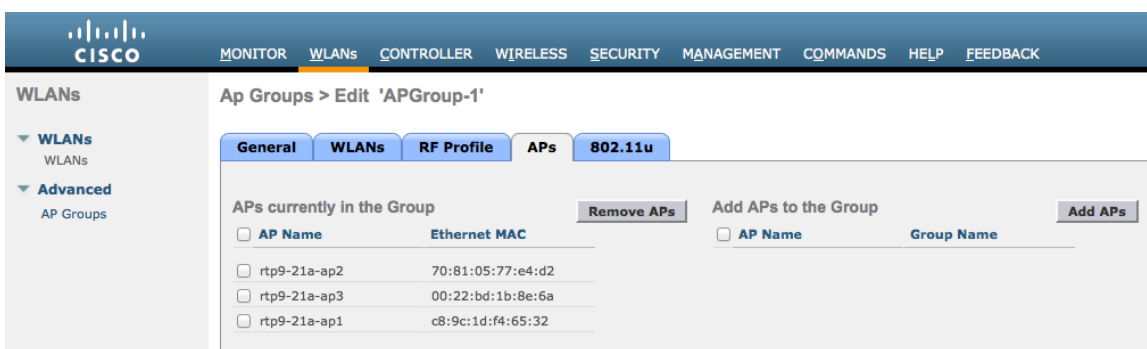

On the **RF Profile** tab, select the desired 802.11a or 802.11b RF Profile, then select **Apply**.

If changes are made after access points have joined the AP Group, then those access points will reboot once those changes are made.

On the **APs** tab, select the desired access points then select **Add APs**.
 Those access points will then reboot.

Controller Settings

Ensure the Cisco Wireless LAN Controller hostname is configured correctly.
 Enable Link Aggregation (LAG) if utilizing multiple ports on the Cisco Wireless LAN Controller.
 Configure the desired AP multicast mode.

Controller

General

Name: WLC5508-1

802.3x Flow Control Mode: Disabled

LAG Mode on next reboot: Enabled (LAG Mode is currently enabled).

Broadcast Forwarding: Disabled

AP Multicast Mode: Unicast

AP Fallback: Enabled

Fast SSID change: Disabled

Default Mobility Domain Name: VTG-VoWLAN

RF Group Name: VTG-VoWLAN

User Idle Timeout (seconds): 300

ARP Timeout (seconds): 300

Web Radius Authentication: PAP

Operating Environment: Commercial (0 to 40 C)

Internal Temp Alarm Limits: 0 to 65 C

WebAuth Proxy Redirection Mode: Disabled

WebAuth Proxy Redirection Port: 0

Maximum Allowed APs: 0

Global IPv6 Config: Enabled

HA SKU secondary unit: Disabled

1. Multicast is not supported with FlexConnect on this platform.
2. Value zero implies there is no restriction on maximum allowed APs.

If utilizing multicast, then **Enable Global Multicast Mode** and **Enable IGMP Snooping** should be enabled.

Controller

Multicast

Enable Global Multicast Mode:

Enable IGMP Snooping:

IGMP Timeout (seconds): 60

IGMP Query Interval (seconds): 20

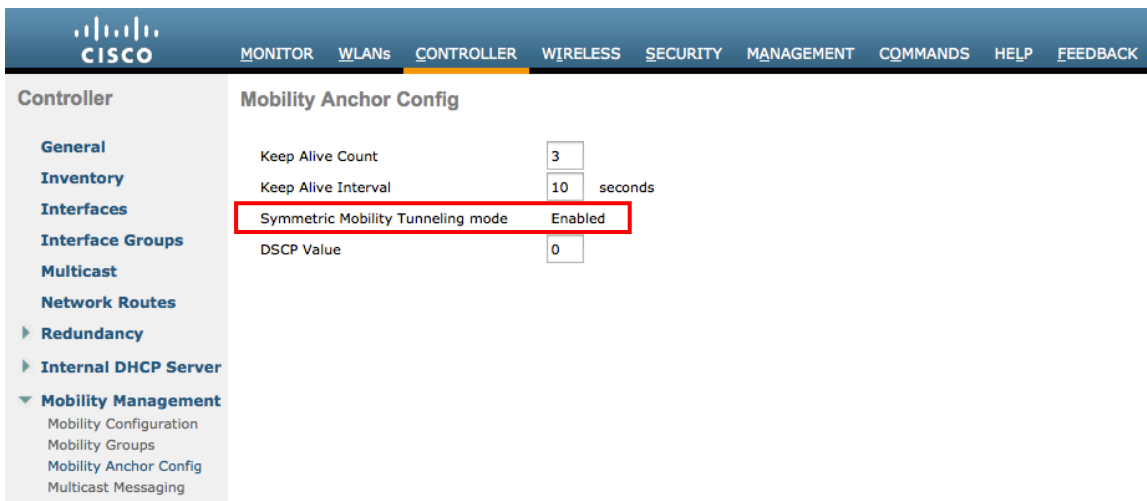

Enable MLD Snooping:

MLD Timeout (seconds): 60

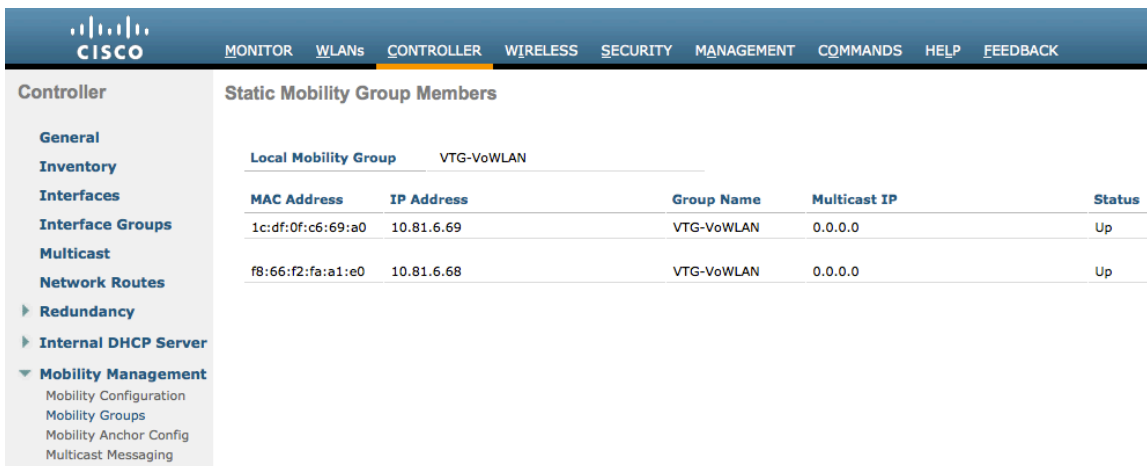

MLD Query Interval (seconds): 20

If utilizing layer 3 mobility, then **Symmetric Mobility Tunneling** should be **Enabled**.

In the recent versions, Symmetric Mobility Tunneling is enabled by default and non-configurable.

When multiple Cisco Wireless LAN Controllers are to be in the same mobility group, then the IP address and MAC address of each Cisco Wireless LAN Controller should be added to the Static Mobility Group Members configuration.

Call Admission Control (CAC)

It is recommended to enable **Admission Control Mandatory** for **Voice** and configure the maximum bandwidth and reserved roaming bandwidth percentages for either 5 or 2.4 GHz depending on which frequency band is to be utilized.

The maximum bandwidth default setting for voice is **75%** where **6%** of that bandwidth is reserved for roaming clients.

Roaming clients are not limited to using the reserved roaming bandwidth, but roaming bandwidth is to reserve some bandwidth for roaming clients in case all other bandwidth is utilized.

If CAC is to be enabled, will want to ensure **Load-based CAC** is enabled.

Load-based CAC will account for all energy on the channel.

SIP CAC can help ensure that downstream voice frames are prioritized correctly when a client does not support TSPEC.

Load based CAC logic is utilized with SIP CAC, so all 802.11 traffic and energy on the channel is accounted for to determine available bandwidth.

The access point has different methods for Call Admission Control when using SIP CAC depending on whether the client uses TCP or UDP for SIP communications.

If the client uses TCP for SIP, then the access point will snoop the SIP packets when media session snooping is enabled on the WLAN and will not forward the SIP frames upstream or downstream if there is not bandwidth available for the new voice stream. This could potentially result in loss of registration to the Cisco Unified Communications Manager.

If the client uses UDP for SIP, then the access point will snoop the SIP packets when media session snooping is enabled on the WLAN and will sent a 486 busy message to the client, which in turn can be interpreted as a **Network Busy** message and the client could either roam to another access point or simply terminate the call setup for that session.

If the Cisco Wireless IP Phone 8821 and 8821-EX uses TCP for SIP communications and the channel is busy where another call can not be allowed, then the Cisco Wireless IP Phone 8821 and 8821-EX could potentially lose registration to the Cisco Unified Communications Manager if SIP CAC is enabled.

The screenshot displays the configuration interface for a Cisco Wireless LAN Controller. The main navigation bar includes 'MONITOR', 'WLANs', 'CONTROLLER', 'WIRELESS', 'SECURITY', 'MANAGEMENT', 'COMMANDS', 'HELP', and 'FEEDBACK'. The left sidebar shows the configuration tree with '802.11a/n/ac' selected. The main content area is titled '802.11a(5 GHz) > Media' and has tabs for 'Voice', 'Video', and 'Media'. The 'Media' tab is active. The 'Call Admission Control (CAC)' section is highlighted with a red box and contains the following settings:

Parameter	Value
Admission Control (ACM)	<input checked="" type="checkbox"/> Enabled
CAC Method	Load Based
Max RF Bandwidth (5-85)(%)	75
Reserved Roaming Bandwidth (0-25)(%)	6
Expedited bandwidth	<input checked="" type="checkbox"/>
SIP CAC Support	<input type="checkbox"/> Enabled

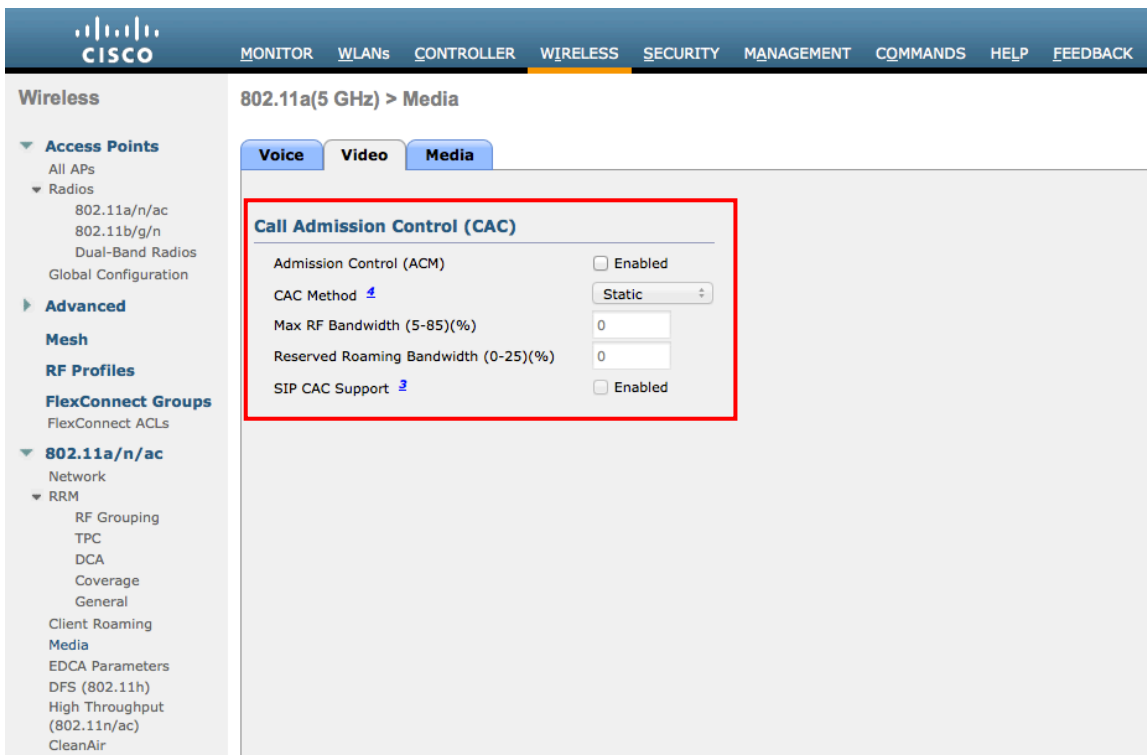

The 'Per-Call SIP Bandwidth' section shows the following settings:

Parameter	Value
SIP Codec	G.711
SIP Bandwidth (kbps)	64
SIP Voice Sample Interval (msecs)	20

The 'Traffic Stream Metrics' section is also highlighted with a red box and contains the following setting:

Parameter	Value
Metrics Collection	<input checked="" type="checkbox"/>

Admission Control Mandatory for Video should be disabled.

If Call Admission Control for voice is enabled, then the following configuration should be active, which can be displayed in the **show run-config**.

```

Call Admission Control (CAC) configuration
Voice AC - Admission control (ACM)..... Enabled
Voice max RF bandwidth..... 75
Voice reserved roaming bandwidth..... 6
Voice load-based CAC mode..... Enabled
Voice tspec inactivity timeout..... Disabled
Video AC - Admission control (ACM)..... Disabled
Voice Stream-Size..... 84000
Voice Max-Streams..... 2
Video max RF bandwidth..... 25
Video reserved roaming bandwidth..... 6

```

The voice stream-size and voice max-streams values can be adjusted as necessary by using the following command. If using SRTP, the Voice Stream-Size may need to be increased.

```
(Cisco Controller) >config 802.11a cac voice stream-size 84000 max-streams 2
```

Ensure QoS is setup correctly under the WLAN configuration, which can be displayed by using the following command.

```
(Cisco Controller) >show wlan <WLAN id>
```

```

Quality of Service..... Platinum (voice)
WMM..... Allowed

```

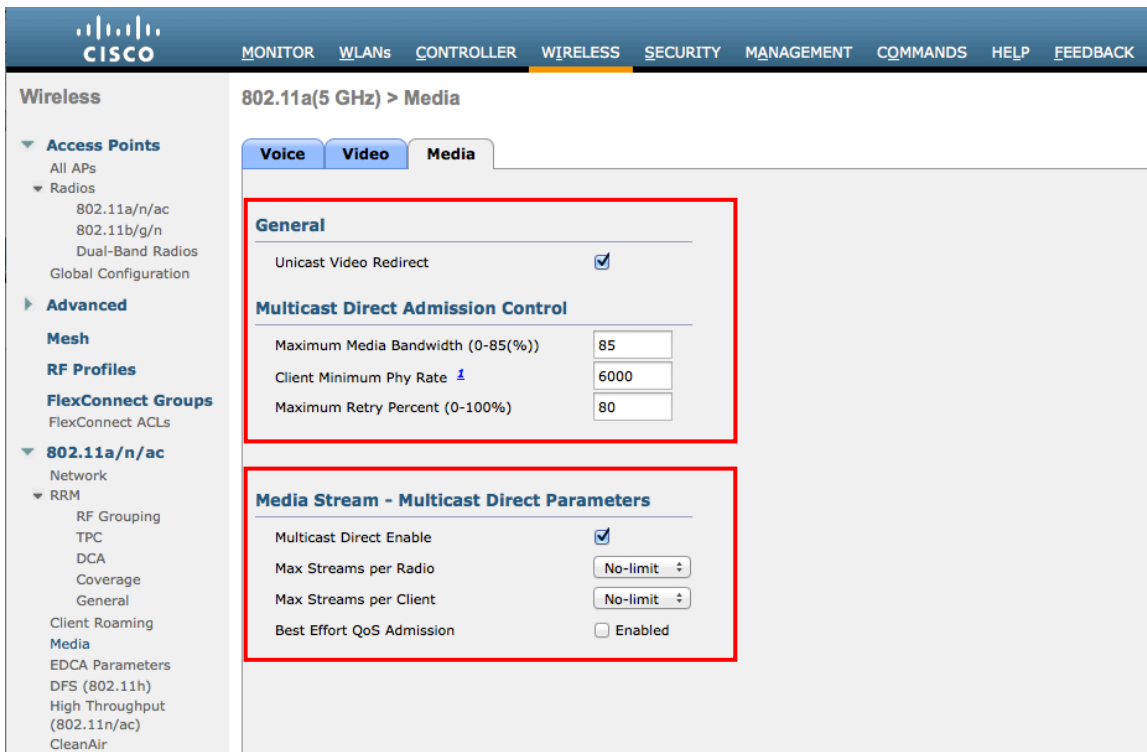

Dot11-Phone Mode (7920)..... ap-cac-limit
Wired Protocol..... 802.1P (Tag=5)

Ensure Voice TSPEC Inactivity Timeout is disabled.

(Cisco Controller) >config 802.11a cac voice tspec-inactivity-timeout ignore

(Cisco Controller) >config 802.11b cac voice tspec-inactivity-timeout ignore

In the Media settings, **Unicast Video Redirect** and **Multicast Direct Enable** should be enabled.

RF Profiles

RF Profiles can be created to specify which frequency bands, data rates, RRM settings, etc. a group of access points should use. It is recommended to have the SSID used by the Cisco Wireless IP Phone 8821 and 8821-EX to be applied to 5 GHz radios only.

RF Profiles are applied to an AP group once created.

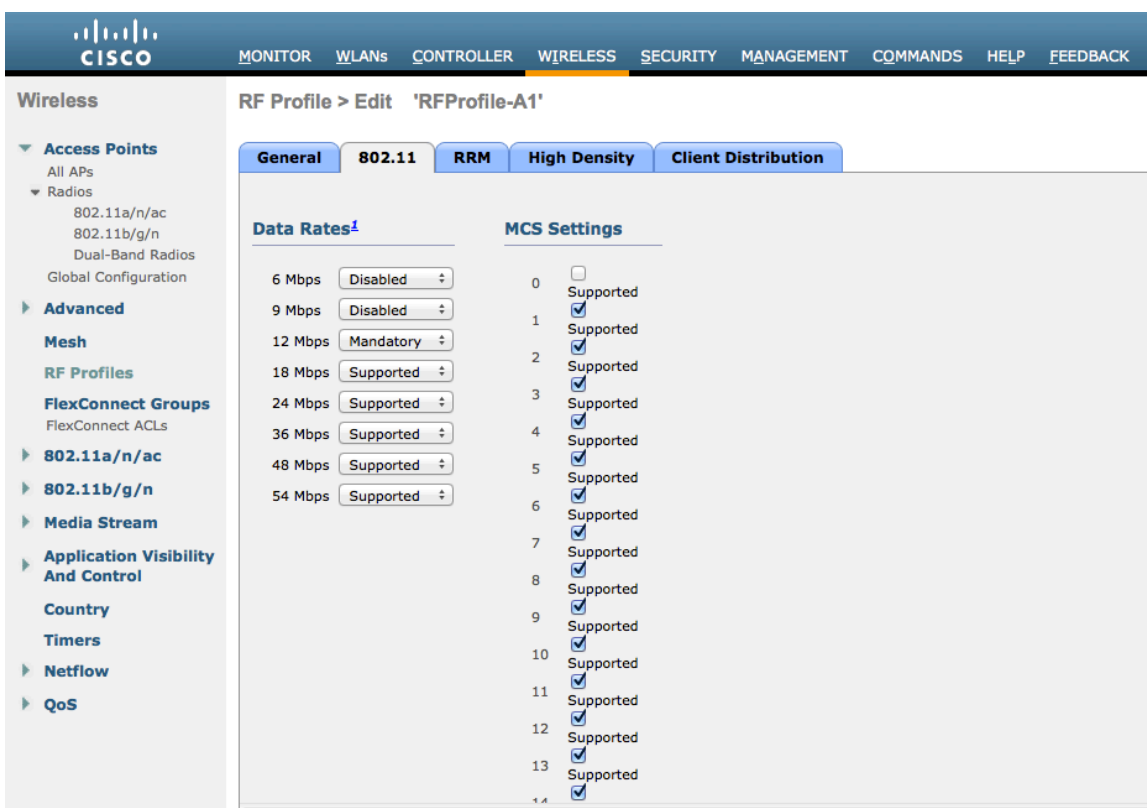

When creating an RF Profile, the **RF Profile Name** and **Radio Policy** must be defined.

Select 802.11a or 802.11b/g for the **Radio Policy**.

On the **802.11** tab, configure the data rates as desired.

It is recommended to enable 12 Mbps as **Mandatory** and 18 Mbps and higher as **Supported**; however some environments may require 6 Mbps to be enabled as a mandatory (basic) rate.

On the **RRM** tab, the **Maximum Power Level Assignment** and **Minimum Power Level Assignment** settings as well as other **DCA**, **TPC**, and **Coverage Hole Detection** settings can be configured.

The screenshot shows the Cisco Wireless LAN Controller configuration interface for an RF Profile named 'RFProfile-A1'. The 'High Density' tab is selected, showing the following configuration options:

- TPC (Transmit Power Control):**
 - Maximum Power Level Assignment (-10 to 30 dBm): 30
 - Minimum Power Level Assignment (-10 to 30 dBm): -10
 - Power Threshold v1(-80 to -50 dBm): -70
 - Power Threshold v2(-80 to -50 dBm): -67
- DCA (Dynamic Channel Allocation):**
 - Avoid AP Foreign AP Interference: Enabled
 - Channel Width: 20 MHz 40 MHz 80 MHz
- DCA Channel List:**
 - DCA Channels: 36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 132, 136, 149, 153, 157, 161
- Coverage Hole Detection:**
 - Data RSSI(-90 to -60 dBm): -80
 - Voice RSSI(-90 to -60 dBm): -80
 - Coverage Exception(1 to 75 Clients): 3
 - Coverage Level(0 to 100 %): 25
- Profile Threshold For Traps:**
 - Interference (0 to 100%): 10
 - Clients (1 to 200): 12
 - Noise (-127 to 0 dBm): -70
 - Utilization (0 to 100 %): 80

On the **High Density** tab, **Maximum Clients**, **Multicast Data Rates**, and **Rx Sop Threshold** can be configured. It is recommended to use the default value (**Auto**) for **Rx Sop Threshold**.

The screenshot shows the Cisco Wireless LAN Controller configuration interface for an RF Profile named 'RFProfile-A1'. The 'High Density' tab is selected, showing the following configuration options:

- High Density Parameters:**
 - Maximum Clients(1 to 200): 200
- Multicast Parameters:**
 - Multicast Data Rates: auto
- Rx Sop Threshold Parameters:**
 - Rx Sop Threshold: Auto

FlexConnect Groups

All access points configured for FlexConnect mode need to be added to a FlexConnect Group.

If utilizing 802.11r (FT) or CCKM, then seamless roams can only occur when roaming to access points within the same FlexConnect Group.

The maximum number of access points allowed per FlexConnect Group is limited, which is WLC model specific.

FlexConnect Groups > Edit 'FlexGroup-1'

Multicast Direct

In the Media Stream settings, **Multicast Direct feature** should be enabled.

Media Stream > General

Multicast Direct feature Enabled

Session Message Config

Session announcement State Enabled
Session announcement URL
Session announcement Email
Session announcement Phone
Session announcement Note

After **Multicast Direct feature** is enabled, then there will be an option to enable **Multicast Direct** in the QoS menu of the WLAN configuration.

The screenshot shows the Cisco WLAN configuration interface for a 'voice' WLAN. The 'QoS' tab is selected, and the 'Advanced' sub-tab is active. The 'Override Per-SSID Bandwidth Contracts (kbps)' section is visible, with fields for Average Data Rate, Burst Data Rate, Average Real-Time Rate, and Burst Real-Time Rate, all set to 0. The 'WMM' section shows 'WMM Policy' set to 'Required', '7920 AP CAC' checked, and '7920 Client CAC' unchecked. The 'Media Stream' section is highlighted with a red box, showing 'Multicast Direct' checked.

QoS Profiles

Configure the four QoS profiles (Platinum, Gold, Silver, Bronze), by selecting **802.1p** as the protocol type and set the **802.1p tag** for each profile.

- Platinum = 5
- Gold = 4
- Silver = 2
- Bronze = 1

- Multicast Default Priority

Wired QoS Protocol

- Protocol Type
- 802.1p Tag

** The value zero (0) indicates the feature is disabled*

The screenshot shows the Cisco Wireless configuration interface. The top navigation bar includes: MONITOR, WLANs, CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, COMMANDS, HELP, FEEDBACK. The left sidebar shows the 'Wireless' menu with options like Access Points, Radios, Advanced, Mesh, RF Profiles, FlexConnect Groups, 802.11a/n/ac, 802.11b/g/n, Media Stream, Application Visibility And Control, Country, Timers, Netflow, and QoS. The main content area is titled 'Edit QoS Profile' for a profile named 'bronze'. It includes a description 'For Background' and two bandwidth contract tables. A red box highlights the 'WLAN QoS Parameters' section, which includes Maximum Priority, Unicast Default Priority, and Multicast Default Priority, all set to 'background'. Below it is the 'Wired QoS Protocol' section, which includes Protocol Type set to '802.1p' and 802.1p Tag set to '1'. A note at the bottom states: '* The value zero (0) indicates the feature is disabled'.

Note: The 802.1p tag mappings were changed with the 7.5.102.0 release. Prior to the 7.5.102.0 release, Platinum = 6, Gold = 5, Silver = 3, Bronze = 1.

Advanced Settings

Advanced EAP Settings

All EAP parameters can be configured at a per SSID level or at the global level, except for the EAP-Broadcast Key Interval, which can only be configured at the global level.

To view or configure the EAP parameters, select **Security** > **Advanced EAP**.

The screenshot shows the Cisco Wireless LAN Controller configuration interface. The top navigation bar includes: MONITOR, WLANs, CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, COMMANDS, HELP, FEEDBACK. The left sidebar shows the 'Security' menu with 'Advanced EAP' selected. The main configuration area is titled 'Advanced EAP' and contains the following parameters and values:

Identity Request Timeout (in secs)	30
Identity request Max Retries	2
Dynamic WEP Key Index	0
Request Timeout (in secs)	30
Request Max Retries	2
Max-Login Ignore Identity Response	enable
EAPOL-Key Timeout (in milliseconds)	400
EAPOL-Key Max Retries	4
EAP-Broadcast Key Interval(in secs)	3600

To view the EAP parameters on the Cisco Wireless LAN Controller via command line, enter the following command.

```
(Cisco Controller) >show advanced eap
```

```
EAP-Identity-Request Timeout (seconds)..... 30
EAP-Identity-Request Max Retries..... 2
EAP Key-Index for Dynamic WEP..... 0
EAP Max-Login Ignore Identity Response..... enable
EAP-Request Timeout (seconds)..... 30
EAP-Request Max Retries..... 2
EAPOL-Key Timeout (milliseconds)..... 400
EAPOL-Key Max Retries..... 4
EAP-Broadcast Key Interval..... 3600
```

If using 802.1x or WPA/WPA2, the **EAP-Request Timeout** on the Cisco Wireless LAN Controller should be set to at least 20 seconds.

In later versions of Cisco Wireless LAN Controller software, the default **EAP-Request Timeout** was changed from 2 to 30 seconds.

For deployments where EAP failures occur frequently, the **EAP-Request Timeout** should be reduced below 30 seconds.

To change the **EAP-Request Timeout** on the Cisco Wireless LAN Controller, telnet or SSH to the controller and enter the following command.

(Cisco Controller) >config advanced eap request-timeout **30**

If using WPA/WPA2 PSK then it is recommended to reduce the **EAPOL-Key Timeout** to 400 milliseconds from the default of 1000 milliseconds with **EAPOL-Key Max Retries** set to 4 from the default of 2.

If using WPA/WPA2, then using the default values where the **EAPOL-Key Timeout** is set to 1000 milliseconds and **EAPOL-Key Max Retries** are set to 2 should work fine, but is still recommended to set those values to 400 and 4 respectively.

The **EAPOL-Key Timeout** should not exceed 1000 milliseconds (1 second).

To change the **EAPOL-Key Timeout** on the Cisco Wireless LAN Controller, telnet or SSH to the controller and enter the following command.

(Cisco Controller) >config advanced eap eapol-key-timeout **400**

To change the **EAPOL-Key Max Retries Timeout** on the Cisco Wireless LAN Controller, telnet or SSH to the controller and enter the following command.

(Cisco Controller) >config advanced eap eapol-key-retries **4**

Ensure **EAP-Broadcast Key Interval** is set to a minimum of 3600 seconds (1 hour).

To change the **EAP-Broadcast Key Interval** on the Cisco Wireless LAN Controller, telnet or SSH to the controller and enter the following command.

(Cisco Controller) >config advanced eap beast-key-interval **3600**

Auto-Immune

The Auto-Immune feature can optionally be enabled for protection against denial of service (DoS) attacks.

Although when this feature is enabled there can be interruptions introduced with voice over wireless LAN, therefore it is recommended to disable the Auto-Immune feature on the Cisco Wireless LAN Controller.

To view the Auto-Immune configuration on the Cisco Wireless LAN Controller, telnet or SSH to the controller and enter the following command.

(Cisco Controller) >show wps summary

Auto-Immune

Auto-Immune..... **Disabled**

Client Exclusion Policy

Excessive 802.11-association failures..... Enabled

Excessive 802.11-authentication failures..... Enabled

Excessive 802.1x-authentication..... Enabled

IP-theft..... Enabled
Excessive Web authentication failure..... Enabled

Signature Policy

Signature Processing..... Enabled

To disable the Auto-Immune feature on the Cisco Wireless LAN Controller, telnet or SSH to the controller and enter the following command.

```
(Cisco Controller) >config wps auto-immune disable
```

CCKM Timestamp Tolerance

The default CCKM timestamp tolerance is set to 1000 ms.

It is recommended to adjust the CCKM timestamp tolerance to 5000 ms to optimize the Cisco Wireless IP Phone 8821 and 8821-EX roaming experience.

```
(Cisco Controller) >config wlan security wpa akm cckm timestamp-tolerance ?
```

```
<tolerance> Allow CCKM IE time-stamp tolerance <1000 to 5000> milliseconds; Default tolerance 1000 msec
```

Use the following command to configure the CCKM timestamp tolerance per Cisco recommendations.

```
(Cisco Controller) >config wlan security wpa akm cckm timestamp-tolerance 5000 <WLAN id >
```

To confirm the change, enter **show wlan <WLAN id>**, where the following will be displayed.

```
CCKM tsf Tolerance..... 5000
```

Rogue Policies

It is recommended to use the default value (**Disable**) for **Rogue Location Discovery Protocol**.

The screenshot shows the Cisco Meraki Security configuration interface. The top navigation bar includes MONITOR, WLANs, CONTROLLER, WIRELESS, SECURITY (highlighted), MANAGEMENT, COMMANDS, HELP, and FEEDBACK. The left sidebar shows the Security menu with options like AAA, Local EAP, Certificate, and Wireless Protection Policies. The main content area is titled 'Rogue Policies' and includes the following settings:

- Rogue Detection Security Level:** Radio buttons for Low, High, Critical, and Custom (selected).
- Rogue Location Discovery Protocol:** Dropdown menu set to 'Disable'.
- Expiration Timeout for Rogue AP and Rogue Client entries:** Input field set to '1200' with 'Seconds' label.
- Validate rogue clients against AAA:** Enabled
- Validate rogue clients against MSE:** Enabled
- Detect and report Ad-Hoc Networks:** Enabled
- Rogue Detection Report Interval (10 to 300 Sec):** Input field set to '10'.
- Rogue Detection Minimum RSSI (-70 to -128):** Input field set to '-128'.
- Rogue Detection Transient Interval (0, 120 to 1800 Sec):** Input field set to '0'.
- Rogue Client Threshold (0 to disable, 1 to 256):** Input field set to '0'.
- Rogue containment automatic rate selection:** Enabled

Below the Rogue Policies section is the 'Auto Contain' section:

- Auto Containment Level:** Dropdown menu set to '1'.
- Auto Containment only for Monitor mode APs:** Enabled
- Auto Containment on FlexConnect Standalone:** Enabled
- Rogue on Wire:** Enabled
- Using our SSID:** Enabled
- Valid client on Rogue AP:** Enabled
- AdHoc Rogue AP:** Enabled

Cisco Meraki Access Points

When configuring Cisco Meraki access points, use the following guidelines:

- Enable **802.11r** for **WPA2-Enterprise** or **Pre-shared key**
- Set **Splash page** to **None**
- Enable **Bridge mode**
- Enable **VLAN tagging**
- Set **Band selection** to **5 GHz band only**
- Configure the **Data Rates** as necessary
- Configure **Quality of Service (QoS)**

Creating the Wireless Network

A wireless network must be created prior to adding any Cisco Meraki access points to provide WLAN service.

Select **Create a new network** from the drop-down menu.

Select **Wireless** for Network type then click **Create**.

SSID Configuration

To create a SSID, select the desired network from the drop-down menu then select **Wireless > Configure > SSIDs**.

It is recommended to have a separate SSID for the Cisco Wireless IP Phone 8821 and 8821-EX; data clients and other type of clients should utilize a different SSID and VLAN.

However, if there is an existing SSID configured to support voice capable Cisco Wireless LAN endpoints already, then that WLAN can be utilized.

To set the SSID name, select **Rename**.

To enable the SSID, select **Enabled** from the drop-down menu.

Network-wide

Access control

SSID: meraki-voice

Network access

Association requirements

- Open (no encryption)
Any user can associate
- Pre-shared key with WPA2
Users must enter a passphrase to associate
- MAC-based access control (no encryption)
RADIUS server is queried at association time
- WPA2-Enterprise with Meraki authentication
User credentials are validated with 802.1X at association time

WPA encryption mode: WPA2 only

802.11r: Enabled

Splash page: None (direct access)
Users can access the network as soon as they associate

Note: Cisco Meraki access points support 802.11r (FT) for fast secure roaming, but do not support Cisco Centralized Key Management (CCKM).

If **WPA2-Enterprise** is enabled where the Cisco Meraki authentication server will be utilized as the RADIUS server, then a user account must be created on the **Network-wide > Configure > Users** page, which the Cisco Wireless IP Phone 8821 and 8821-EX will be configured to use for 802.1x authentication.

Note: Cisco Meraki access points do not support EAP-FAST.

<input type="checkbox"/>	Description	Email (Username)	Account type	Authorized for SSID ▲
<input type="checkbox"/>	1 Michael Gillespie	mikeg@cisco.com	Meraki 802.1X	Yes

On the **Wireless > Configure > Access control** page, recommend to enable **Bridge mode**, where the Cisco Wireless IP Phone 8821 and 8821-EX will obtain DHCP from the local LAN instead of the Cisco Meraki network; unless call control, other endpoints, etc. are cloud-based.

Once **Bridge mode** is enabled, the VLAN tagging option will be available.

It is recommended to enable **VLAN tagging** for the SSID.

If VLAN tagging is utilized, ensure that the Cisco Meraki access point is connected to a switch port configured for trunk mode allowing that VLAN.

If utilizing Cisco Meraki MS Switches, reference the Cisco Meraki MS Switch VoIP Deployment Guide.

https://meraki.cisco.com/lib/pdf/meraki_whitepaper_msvoip.pdf

If utilizing Cisco IOS Switches, use the following switch port configuration for ports that have Cisco Meraki access points connected to enable 802.1q trunking.

```
Interface GigabitEthernet X
switchport trunk encapsulation dot1q
switchport mode trunk
mls qos trust dscp
```

Addressing and traffic

Client IP assignment

- NAT mode: Use Meraki DHCP
Clients receive IP addresses in an isolated 10.0.0.0/8 network. Clients cannot communicate with each other, but they may communicate with devices on the wired LAN if the [SSID firewall settings](#) permit.
- Bridge mode: Make clients part of the LAN
Meraki devices operate transparently (no NAT or DHCP). Clients receive DHCP leases from the LAN or use static IPs. Use this for shared printers, file sharing, and wireless cameras.
- Layer 3 roaming
Clients receive DHCP leases from the LAN or use static IPs as in bridge mode. If they roam between APs their traffic will be forwarded to an AP on the same subnet they originally joined, so they will keep the same IP address.
- Layer 3 roaming with a concentrator
Clients are tunneled to a specified VLAN at the concentrator. They will keep the same IP address when roaming between APs.
- VPN: tunnel data to a concentrator
Meraki devices send traffic over a secure tunnel to an MX or VM concentrator.

On the **Wireless > Configure > Access control** page, the frequency band for the SSID to be used by the Cisco Wireless IP Phone 8821 and 8821-EX can be configured as necessary.

It is recommended to select **5 GHz band only** to have the Cisco Wireless IP Phone 8821 and 8821-EX operate on the 5 GHz band due to have many channels available and not as many interferers as the 2.4 GHz band has.

If the 2.4 GHz band needs to be used due to increased distance, then **Dual band operation (2.4 GHz and 5 GHz)** should be selected. Do not utilize the **Dual band operation with Band Steering** option.

It is recommended to disable data rates below 12 Mbps unless a legacy 2.4 GHz client needs to be able to connect to the Wireless LAN.

Cisco Meraki access points currently utilize a DTIM period of **1** with a beacon period of **100 ms**; which both are non-configurable.

Wireless options

Band selection

Dual band operation (2.4 GHz and 5 GHz)

5 GHz band only
5 GHz has more capacity and less interference than 2.4 GHz, but legacy clients are not capable of using it.

Dual band operation with Band Steering
Band Steering detects clients capable of 5 GHz operation and steers them to that frequency, while leaving 2.4 GHz available for legacy clients.

Minimum bitrate (Mbps)

Lower Density Higher Density

1 2 5.5 6 9 11 12 18 24 36 48 54

802.11b devices not supported

On the **Wireless > Configure > SSID availability** page, the SSID can be broadcasted by setting **Visibility** to **Advertise this SSID publicly**.

Is recommended to set **Per-AP Availability** to **This SSID is enabled on all APs**.

A schedule for SSID availability can be configured as necessary, however it is recommended to set **Scheduled Availability** to **Disabled**.

Scheduled availability

Radio Settings

On the **Wireless > Configure > Radio settings** page, configure what radio transmit power and channel settings to use.

For the **Radio power** setting, it is recommended to select **Enable power reduction on nearby APs** as co-channel interference can be potentially reduced. If wanting to use maximum radio power, then select **Always use 100% power**.

Can select whether to enable use of DFS channels or not via the **Auto channel** option.

The **Default 5 GHz channel width** is set to 80 MHz by default and that channel width will be utilized if the access point is 802.11ac capable. The **Default 5 GHz channel width** can also be set to use 20 MHz or 40 MHz.

It is recommended to utilize the same channel width for all access points.

Channel planning

Country i

Regulatory domain

Radio power i

Auto channel i

Default 5GHz channel width i

If **Channel width** is set to **Auto** for an access point, then that access point will use the value specified for **Default 5 GHz channel width** if applicable for that access point model.

The channel width can also be configured on a per access point basis overriding the default.

2.4 GHz radios utilize 20 MHz channel width and can not be configured for 40 MHz channels.

It is recommended to utilize the same channel width for all access points.

When using Cisco Meraki access points it is recommended to select **Auto** for the channel and transmit power.

When **Auto** is selected for 2.4 GHz channels, only channels 1, 6, and 11 will be utilized.

Configure the access point transmit power level assignment method for either 5 or 2.4 GHz depending on which frequency band is to be utilized.

Individual access points can be configured with static channel and transmit power for either 5 or 2.4 GHz radios, which may be necessary if there is an intermittent interferer present in an area. While other access points can be enabled for **Auto** and work around the access points that are have static channel assignments.

Note: Cisco Meraki access points do not support Dynamic Transmit Power Control (DTPC), therefore the Cisco Wireless IP Phone 8821 and 8821-EX will utilize the maximum transmit power supported for the current channel and data rate.

Traffic Shaping

On the **Wireless > Configure > Firewall & traffic shaping** page, traffic shaping rules can be defined.

To allow traffic shaping rules to be defined select **Shape traffic on this SSID** in the drop-down menu for **Shape traffic**.

Once **Shape traffic on this SSID** has been applied, then select **Create a new rule** to define **Traffic shaping rules**.

By default, Cisco Meraki access points currently tag voice frames marked with DSCP EF (46) as WMM UP 5 instead of WMM UP 6 and call control frames marked with DSCP CS3 (24) as WMM UP 3 instead of WMM UP 4.

The screenshot shows the Cisco Meraki configuration interface. At the top left is the Cisco Meraki logo. Below it, the 'Network' is set to 'Cisco'. The left sidebar has 'Wireless' selected. The main content area is titled 'Firewall & traffic shaping' and shows the SSID 'meraki-voice'. Under the 'Firewall' section, there are two tables for Layer 3 and Layer 7 firewall rules. The Layer 3 table has two rows: one for 'Local LAN' and one for 'Any'. The Layer 7 section states 'There are no rules defined for this SSID'. Under the 'Traffic shaping rules' section, there are three settings: 'Per-client bandwidth limit' (unlimited), 'Per-SSID bandwidth limit' (unlimited), and 'Shape traffic' (set to 'Don't shape traffic on this SSID').

#	Policy	Protocol	Destination	Port	Comment	Actions
	Allow	Any		Local LAN	Any	Wireless clients accessing LAN
	Allow	Any	Any	Any	Default rule	

Note: Cisco Meraki access points do not support Call Admission Control / Traffic Specification (TSPEC).

Cisco Autonomous Access Points

When configuring Cisco Autonomous Access Points, use the following guidelines:

- Ensure **802.11r (FT)** or **CCKM** is **Enabled**
- Configure the **Data Rates** as necessary
- Enable **DTPC**
- Configure **Quality of Service (QoS)**
- Set the **WMM Policy** to **Required**
- Ensure **Aironet Extensions** is **Enabled**
- Disable **Public Secure Packet Forwarding (PSPF)**
- Set **IGMP Snooping** to **Enabled**

802.11 Network Settings

It is recommended to have the Cisco Wireless IP Phone 8821 and 8821-EX operate on the 5 GHz band only due to have many channels available and not as many interferers as the 2.4 GHz band has.

If wanting to use 5 GHz, ensure the 802.11a/n/ac network status is **Enabled**.

Network Interfaces: Summary			
System Settings			
IP Address (Static)	10.9.0.9		
IP Subnet Mask	255.255.255.0		
Default Gateway	10.9.0.2		
MAC Address	18e7.281b.3f54		
Interface Status	GigabitEthernet	Radio0-802.11N2.4GHz	Radio1-802.11AC5GHz
Software Status	Enabled	Disabled	Enabled
Hardware Status	Up	Down	Up
Interface Resets	5	0	8

It is recommended to enable 11r over air to enable fast secure roaming.

Recommended to set 12 Mbps as the mandatory (basic) rate and 18 Mbps and higher as supported (optional) rates; however some environments may require 6 Mbps to be enabled as a mandatory (basic) rate.

If using 5 GHz, it is recommended to enable up to 12 channels only to avoid any potential delay of access point discovery due to having to scan many channels.

For Cisco Autonomous Access Points, select Dynamic Frequency Selection (DFS) to use auto channel selection.

When DFS is enabled, enable at least one band (bands 1-4).

Can select band 1 only for the access point to use a UNII-1 channel (channel 36, 40, 44, or 48).

Individual access points can be configured to override the global setting to use dynamic channel and transmit power assignment for either 5 or 2.4 GHz depending on which frequency band is to be utilized.

Other access points enabled can be enabled for Auto RF and workaround the access points that are statically configured.

This may be necessary if there is an intermittent interferer present in an area.

The 5 GHz channel width can be configured for 20 MHz or 40 MHz if using Cisco 802.11n Access Points and 20 MHz, 40 MHz, or 80 MHz if using Cisco 802.11ac Access Points.

It is recommended to utilize the same channel width for all access points.

Ensure **Client Power** is configured properly. Do not use default setting of **Max** power for client power on Cisco Autonomous Access Points as that will not advertise DTPC to the client.

Enable **Dot11d** for **World Mode** and configure the proper **Country Code**.

Ensure **Aironet Extensions** is enabled.

Set the **Beacon Period** to **100 ms** and **DTIM** to **2**.

Save Configuration | Ping | Logout | Refresh

If wanting to use 2.4 GHz, ensure the 802.11b/g/n network status and 802.11g is enabled.

Recommended to set 12 Mbps as the mandatory (basic) rate and 18 Mbps and higher as supported (optional) rates assuming that there will not be any 802.11b only clients that will connect to the wireless LAN; however some environments may require 6 Mbps to be enabled as a mandatory (basic) rate.

If 802.11b clients exist, then 11 Mbps should be set as the mandatory (basic) rate and 12 Mbps and higher as supported (optional).

WLAN Settings

It is recommended to have a separate SSID for the Cisco Wireless IP Phone 8821 and 8821-EX.

However, if there is an existing SSID configured to support voice capable Cisco Wireless LAN endpoints already, then that WLAN can be utilized instead.

The SSID to be used by the Cisco Wireless IP Phone 8821 and 8821-EX can be configured to only apply to a certain 802.11 radio type (e.g. 802.11a only).

Enable **WPA2** key management.

Ensure either **11r** or **CCKM** is enabled, where 11r is recommended.

The screenshot shows the Cisco WLC configuration interface for a WLAN. The top navigation bar includes links for Home, Network, Association, Wireless, Security, Services, Management, Software, and Event Log. Global Properties

Broadcast Key Rotation Interval: Disable Rotation
 Enable Rotation with Interval: (10-10000000 sec)

WPA Group Key Update: Enable Group Key Update On Membership Termination
 Enable Group Key Update On Member's Capability Change

Configure the RADIUS servers to be used for authentication and accounting.

Wireless Domain Services (WDS)

Wireless Domain Services should be utilized in the Cisco Autonomous Access Point environment, which is also required for fast secure roaming.

Select one access point to be the primary WDS server and another to be the backup WDS server.

Configure the primary WDS server with the highest priority (e.g. 255) and the backup WDS server with a lower priority (e.g. 254).

The Cisco Autonomous Access Points utilize Inter-Access Point Protocol (IAPP), which is a multicast protocol, therefore should use a dedicated native VLAN for Cisco Autonomous Access Points.

For the native VLAN, it is recommended to not use VLAN 1 to ensure that IAPP packets are exchanged successfully.

Port security should be disabled on switch ports that Cisco Autonomous Access Points are directly connected to.

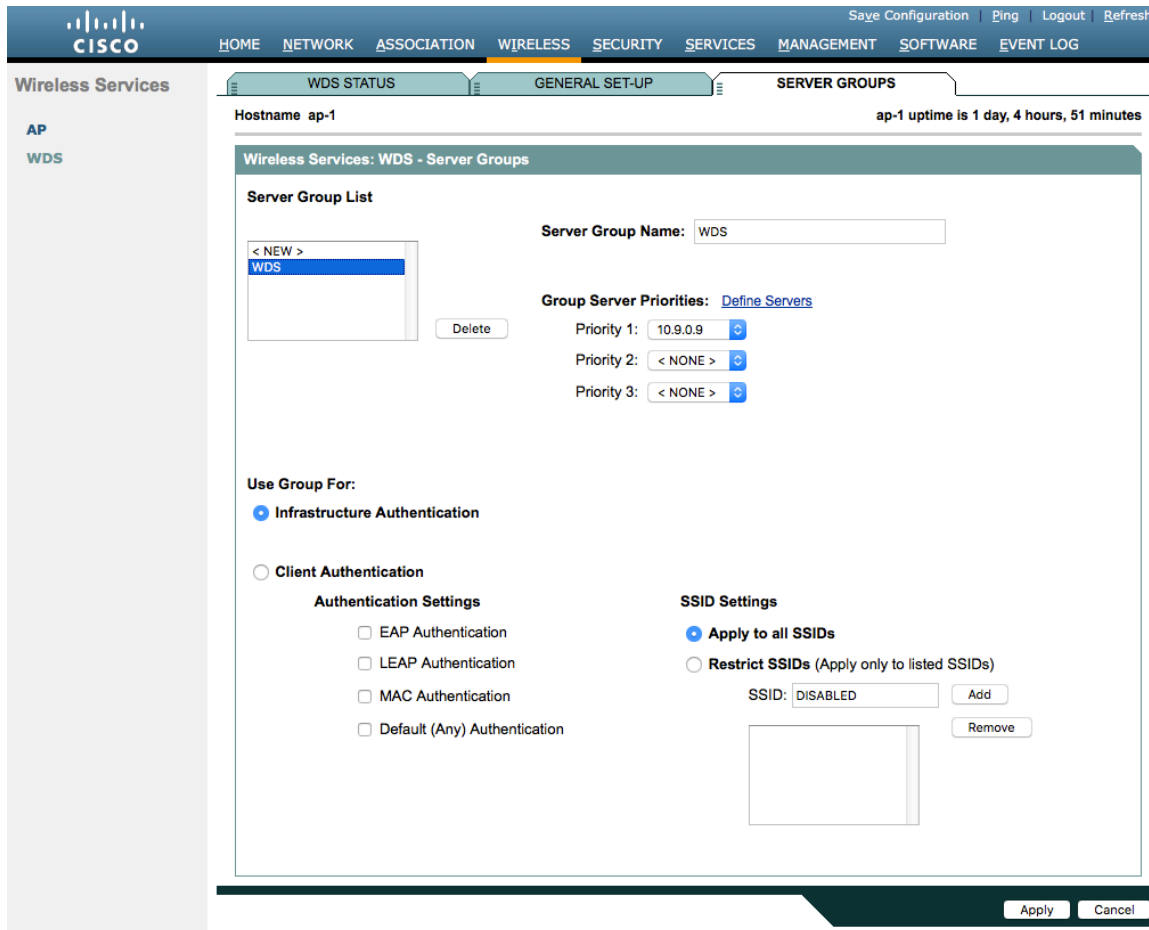

Server groups for Wireless Domain Services must be defined.

First, define the server group to be used for infrastructure authentication.

Is recommended to use local RADIUS for infrastructure authentication.

If not using local RADIUS for infrastructure authentication, then need to ensure that all access points with Wireless Domain Services enabled are configured in the RADIUS server.

Then, define the server group to be used for client authentication.

Will need to ensure that all access points with Wireless Domain Services enabled are configured in the RADIUS server.

To utilize local RADIUS for infrastructure authentication, enable all authentication protocols.

Create a **Network Access Server** entry for the local access point.

Define the user account in which access points will be configured for to authenticate to the Wireless Domain Services enabled access point.

Configure local RADIUS on each access point participating in Wireless Domain Services.

The screenshot displays the Cisco configuration page for EAP-FAST Set-Up. The top navigation bar includes 'HOME', 'NETWORK', 'ASSOCIATION', 'WIRELESS', 'SECURITY', 'SERVICES', 'MANAGEMENT', 'SOFTWARE', and 'EVENT LOG'. The left sidebar lists various security management tools. The main content area is titled 'EAP-FAST SET-UP' and shows the configuration for a Local RADIUS Server.

Local Radius Server Authentication Settings

Enable Authentication Protocols:

- EAP FAST
- LEAP
- MAC

Buttons: Apply, Cancel

Network Access Servers (AAA Clients)

Current Network Access Servers

Network Access Server	Network Access Server (IP Address)	Shared Secret

User Groups

Current User Groups

Group Name	Session Timeout (optional)	Failed Authentications before Lockout (optional)	Lockout (optional)	VLAN ID (optional)	SSID (optional)
< NEW >			<input type="radio"/> Infinite <input checked="" type="radio"/> Interval		

Buttons: Delete, Add, Apply, Cancel

Once the desired access points have been configured successfully to enable Wireless Domain Services, then all access points including those serving as WDS servers need to be configured to be able to authenticate to the WDS servers.

Enable **Participate in SWAN Infrastructure**.

If using a single WDS server, then can specify the IP address of the WDS server; otherwise enable **Auto Discovery**.

Enter the **Username** and **Password** to be used to authenticate to the WDS server.

Hostname ap-1 ap-1 uptime is 1 day, 4 hours, 50 minutes

Wireless Services: AP

Participate in SWAN Infrastructure: Enable Disable

WDS Discovery: Auto Discovery Specified Discovery: (IP Address)

Username:

Password:

Confirm Password:

Authentication Methods Profile: [Define Authentication Methods Profiles](#)

Once the access point has been configured to authenticate to the WDS server, can check WDS Status to see the WDS server state as well as how many access points are registered to the WDS server.

Hostname ap-1 ap-1 uptime is 1 day, 5 hours, 1 minute

Wireless Services: WDS - Wireless Domain Services - Status

WDS Information

MAC Address	IPv4 Address	IPv6 Address	Priority	State

MAC Address	IP Address	State	SSID	VLAN ID	BSSID

Wireless Network Manager Information

IP Address	Authentication Status

Call Admission Control (CAC)

Load-based CAC and support for multiple streams are not present on the Cisco Autonomous Access Points therefore it is not recommended to enable CAC on Cisco Autonomous Access points.

The Cisco Autonomous Access Point only allows for 1 stream and the stream size is not customizable, therefore SRTP, Barge, Silent Monitoring, and Call Recording will not work if CAC is enabled.

If enabling Admission Control for Voice or for Video on the Cisco Autonomous Access Point, the admission must be unblocked on the SSID as well. In recent releases, the admission is unblocked by default.

```
dot11 ssid voice
vlan 3
authentication open eap eap_methods
authentication network-eap eap_methods
authentication key-management wpa version 2 dot11r
admit-traffic
```

The screenshot shows the Cisco configuration interface for QoS Policies - Access Category. The interface is divided into several sections:

- Services: QoS Policies - Access Category**
- Access Category Definition**: A table with the following data:

Access Category	Background (CoS 1-2)	Best Effort (CoS 0,3)	Video (CoS 4-5)	Voice (CoS 6-7)
Min Contention Window (2^x-1; x can be 0-10)	AP: 4	4	3	2
	Client: 4	4	3	2
Max Contention Window (2^x-1; x can be 0-10)	AP: 10	6	4	3
	Client: 10	10	4	3
Fixed Slot Time (0-20)	AP: 7	3	1	1
	Client: 7	3	2	2
Transmit Opportunity (0-65535 μs)	AP: 0	0	3008	1504
	Client: 0	0	3008	1504
- Admission Control for Video and Voice**:
 - Video(CoS 4-5)**: Admission Control
 - Voice(CoS 6-7)**: Admission Control
 - Max Channel Capacity (%): 75
 - Roam Channel Capacity (%): 6

QoS Policies

Configure the following QoS policy on the Cisco Autonomous Access Point to enable DSCP to CoS (WMM UP) mapping.

This allows packets to be placed into the proper queue as long as those packets are marked correctly when received at the access point level.

Apply Cancel

To enable QBSS, select **Enable** and check **Dot11e**.

If **Dot11e** is checked, then both CCA versions (802.11e and Cisco version 2) will be enabled.

Ensure **IGMP Snooping** is enabled.

Ensure **Wi-Fi MultiMedia (WMM)** is enabled.

If enabling the **Stream** feature either directly or via selecting **Optimized Voice** for the radio access category in the QoS configuration section, then use the defaults, where 5.5, 6, 11, 12 and 24 Mbps are enabled as nominal rates for 802.11b/g, 6, 12, and 24 Mbps enabled for 802.11a and 6.5, 13, and 26 Mbps enabled for 802.11n.

If the **Stream** feature is enabled, ensure that only voice packets are being put into the voice queue. Signaling packets (SIP) should be put into a separate queue. This can be ensured by setting up a QoS policy mapping the DSCP to the correct queue.

Save Configuration | Ping | Logout | Refresh

Configuring Cisco Call Control

Cisco Unified Communications Manager

Cisco Unified Communications Manager offers many different phone, call and security features.

When adding the Cisco Wireless IP Phone 8821 or 8821-EX to the Cisco Unified Communications Manager it must be provisioned using the wireless LAN MAC address.

The wireless LAN MAC address of the Cisco Wireless IP Phone 8821 or 8821-EX can be found by navigating to **Settings > Phone information > Model information**.

The screenshot shows the 'Device Information' configuration page. It includes a 'Device is trusted' checkbox which is checked. Below it are several fields: 'MAC Address*' (empty), 'Description' (empty), 'Device Pool*' (set to '-- Not Selected --' with a 'View Details' link), 'Common Device Configuration' (set to '< None >' with a 'View Details' link), 'Phone Button Template*' (set to '-- Not Selected --'), 'Softkey Template' (set to '< None >'), and 'Common Phone Profile*' (set to 'Standard Common Phone Profile' with a 'View Details' link).

Device Pools

When creating a new Cisco Wireless IP Phone 8821 or 8821-EX, a **Device Pool** must be configured.

The device pool defines common settings (e.g. Cisco Unified Communications Manager Group, etc.), roaming sensitive settings (e.g. Date/Time Group, Region, etc.), local route group settings, device mobility related information settings, and other group settings.

Device Pools can be used to either group devices per location, per model type, etc.

Phone Button Templates

When creating a new Cisco Wireless IP Phone 8821 or 8821-EX, a **Phone Button Template** must be configured.

Custom phone button templates can be created with the option for many different features, which can then be applied on a device or group level.

Phone Button Template Information

Security Profiles

When creating a new Cisco Wireless IP Phone 8821 or 8821-EX, a **Device Security Profile** must be configured.

Security profiles can be utilized to enable authenticated mode or encrypted mode, where signaling, media and configuration file encryption is then enabled.

The Certificate Authority Proxy Function (CAPF) must be operational in order to utilize a Locally Signed Certificate (LSC) with a security profile.

The Cisco Wireless IP Phone 8821 and 8821-EX have a Manufacturing Installed Certificate (MIC), which can be utilized with a security profile as well.

-----------------	------

SIP Profiles

When creating a new Cisco Wireless IP Phone 8821 or 8821-EX, a **SIP Profile** must be configured.

It is recommended to create a custom SIP Profile for the Cisco Wireless IP Phone 8821 and 8821-EX (do not use the **Standard SIP Profile** or **Standard SIP Profile for Mobile Device**).

The screenshot shows the 'Protocol Specific Information' configuration page. The 'SIP Profile*' field is highlighted with a red box and set to 'Custom 8821 SIP Profile'. A 'View Details' link is visible next to the dropdown. Other fields include Packet Capture Mode (None), Packet Capture Duration (0), BLF Presence Group (Standard Presence group), SIP Dial Rules (< None >), MTP Preferred Originating Codec (711ulaw), Device Security Profile (Cisco 8821 - Standard SIP Secure Profile), Rerouting Calling Search Space (< None >), SUBSCRIBE Calling Search Space (< None >), and Digest User (< None >). There are also several unchecked checkboxes: Media Termination Point Required, Unattended Port, Require DTMF Reception, and Early Offer support for voice and video calls (Insert MTP if needed).

To create a custom SIP Profile for the Cisco Wireless IP Phone 8821 or 8821-EX, use the **Standard SIP Profile** as the reference template.

Copy the **Standard SIP Profile**, then change the following parameters.

Timer Register Delta (seconds) = 30 (default = 5)

Timer Keep Alive Expires (seconds) = 300 (default = 120)

Timer Subscribe Expires (seconds) = 300 (default = 120)

Timer Subscribe Delta (seconds) = 15 (default = 5)

Ensure **SIP Station KeepAlive Interval** at **System > Service Parameters > Cisco CallManager** remains configured for 120 seconds.

Common Settings

Some settings such as Bluetooth can be configured on an enterprise phone, common phone profile or individual phone level. Bluetooth is enabled by default for the Cisco Wireless IP Phone 8821 and 8821-EX. Override common settings can be enabled at either configuration level.

Bluetooth *

QoS Parameters

The DSCP values to be used for SIP communications, phone configuration, and phone based services to be used by the phone are defined in the Cisco Unified Communications Manager's Enterprise Parameters.

The default DSCP value for SIP communications and phone configuration is set to CS3.
 Phone based services are configured to be best effort traffic by default.

Parameter Name	Parameter Value	Suggested Value
Cluster ID *	StandAloneCluster	StandAloneCluster
Max Number of Device Level Trace *	12	12
DSCP for Phone-based Services *	default DSCP (000000)	default DSCP (000000)
DSCP for Phone Configuration *	CS3(precedence 3) DSCP (011000)	CS3(precedence 3) DSCP (011000)
DSCP for Cisco CallManager to Device Interface *	CS3(precedence 3) DSCP (011000)	CS3(precedence 3) DSCP (011000)
Connection Monitor Duration *	120	120
Auto Registration Phone Protocol *	SCCP	SCCP

G.722 and iSAC Advertisement

Cisco Unified Communications Manager supports the ability to configure whether G.722 and iSAC are to be a supported codec system wide or not.

G.722 and iSAC codecs can be disabled at the enterprise phone, common phone profile or individual phone level by setting **Advertise G.722 and iSAC Codecs** to **Disabled**.

Advertise G.722 and iSAC Codecs *

Audio Bit Rates

The audio bit rate can be configured by creating or editing existing Regions in the Cisco Unified Communications Manager. It is recommended to select G.722 or G.711 for the audio codec.

Audio Codec Preference List	Maximum Audio Bit Rate	Maximum Session Bit Rate for Video Calls	Maximum Session Bit Rate for Immersive Video Calls
Keep Current Setting	<input checked="" type="radio"/> 64 kbps (G.722, G.711) <input type="radio"/> kbps	<input type="radio"/> Keep Current Setting <input type="radio"/> Use System Default <input type="radio"/> None <input checked="" type="radio"/> 2000 kbps	<input checked="" type="radio"/> Keep Current Setting <input type="radio"/> Use System Default <input type="radio"/> None <input type="radio"/> kbps

Use the following information to configure the audio bit rate to be used for audio calls.

Audio Codec	Audio Bit Rate
Opus	6-510 Kbps
G.722 / G.711	64 Kbps
iSAC	32 Kbps
iLBC	16 Kbps
G.729	8 Kbps

Wireless LAN Profiles

With Cisco Unified Communications Manager 10.0 release and later, the Cisco Wireless IP Phone 8821 and 8821-EX can be provisioned with Wireless LAN Profiles via the Cisco Unified Communications Manager.

With Cisco Unified Communications Manager 11.0 and later, EAP-TLS support is included.

Use the following guidelines to configure a Wireless LAN profile within Cisco Unified Communications Manager to then apply to a Cisco Wireless IP Phone 8821 or 8821-EX.

- Prior to creating a Wireless LAN Profile and associating it to a Cisco Wireless IP Phone 8821 and 8821-EX, the Cisco Wireless IP Phone 8821 and 8821-EX should be configured to utilize a security profile in which TFTP encryption is enabled so Wireless LAN Profile data is not passed down to the Cisco Wireless IP Phone 8821 and 8821-EX in clear text via TFTP.

Phone Security Profile Information

Product Type: Cisco 8821

Device Protocol: SIP

Name* Cisco 8821 - Standard SIP Secure Profile

Description Cisco 8821 - Standard SIP Secure Profile

Nonce Validity Time* 600

Device Security Mode Encrypted

Transport Type* TLS

Enable Digest Authentication

TFTP Encrypted Config

- Once the security profile has been created, it then needs to be applied to the Cisco Wireless IP Phone 8821 and 8821-EX to enable TFTP encryption for that Cisco Wireless IP Phone 8821 and 8821-EX' configuration files.
- Select the configured security profile from the **Device Security Profile** drop-down menu.

Cisco Unified Communications Manager Express

With release 10.5 of Cisco Unified Communications Manager Express, the Cisco Wireless IP Phone 8821 and 8821-EX are to utilize the fast track method utilizing the Cisco Unified IP Phone 9971 as the reference model (use 7975 as reference model if needing softkey template support).

With release 11.0 and 11.5 of Cisco Unified Communications Manager Express, the Cisco Wireless IP Phone 8821 and 8821-EX can utilize the Cisco IP Phone 8861 as the reference model.

With release 11.7 and later of Cisco Unified Communications Manager Express, there is native support for the Cisco Wireless IP Phone 8821 and 8821-EX, therefore can use the Cisco IP Phone 8821 as the model type.

Product Specific Configuration Options

In Cisco Unified Communications Manager Administration, the following configuration options are available for the Cisco Wireless IP Phone 8821 and 8821-EX.

For a description of these options, click ? at the top of the configuration page.

Product specific configuration options can be configured in bulk via the Bulk Admin Tool if using Cisco Unified Communications Manager.

Some of the product specific configuration options can be configured on an enterprise phone, common phone profile or individual phone configuration level.

Cisco Wireless IP Phone 8821 and 8821-EX Common Configuration Options

Product Specific Configuration Layout 

	Parameter Value	Override Enterprise/Common Phone Profile Settings
<input type="checkbox"/> Disable Speakerphone

<u>Field Name</u>	<u>Description</u>
Disable Speakerphone	This parameter disables the speakerphone functionality. Disabling speakerphone functionality will not affect the headset. You can use lines and speed dials with headset/handset.
Disable Speakerphone and Headset	This parameter disables all speakerphone and headset functions.
Settings Access	This parameter specifies whether the Settings menu on the phone is functional. When Settings Access is enabled, you can change the phone configuration, ring type, etc. on the phone. When Settings Access is disabled, configuration changes are not allowed. When Settings Access is Restricted, you can only change user preferences.
Web Access	This parameter specifies whether the phone will accept connections from a web browser or other HTTP client. Disabling the web server functionality of the phone will block access to the phones internal web pages. These pages provide statistics and configuration information. Features, such as QRT (Quality Report Tool), will not function properly without access to the phones web pages. This setting will also affect any serviceability application such as CiscoWorks that relies on web access.
HTTPS Server	This parameter specifies whether to permit HTTP and HTTPS or HTTPS only connections if Web Access is enabled.
Web Admin	This parameter controls the accessibility of the Web Admin interface, which operates independently from the Web Access parameter. If disabled, then the Web Admin interface is not available. If enabled, then the Web Admin interface is available, but also requires the Admin Password to be specified.
Admin Password	This parameter specifies the password to access the phone's Web Admin interface. Enter a 8-127 character password.
Bluetooth	This parameter specifies whether the phone's Bluetooth is enabled or disabled.
WLAN Profile 1 Prompt Mode	This parameter enables or disables prompt mode for WLAN Profile 1 only, where user credentials are not saved to flash.
Out of Range Alert	This parameter controls the frequency of audible alerts when the phone is out of range of an access point. If disabled, the phone does not play audible alerts. If enabled, the phone can beep once or regularly at a selected interval (10, 30, or 60 seconds) when it is out of range of an access point and once the phone is reconnected to an access point, audible alerts will stop.
Scan Mode	This parameter controls when the phone performs scanning. If Continuous is selected, then the phone scans continuously even when it is not in a call. If Auto is selected, then the phone scans when it is in a call or when the received strength signal indicator (RSSI) threshold has been met when not in a call. If Single AP is selected, then the phone does not scan except when first powered on or when the connection is lost.
Application URL	This parameter specifies the URL which the phone utilizes for application services including Push To Talk (PTT).
Application Button Activation Timer	This parameters specifies the amount of time one must hold down the Application Button to activate the application specified in the Application URL. The timer

	values are in seconds. A value of 0 indicates that a simple push of the Application Button will activate the application. For non-zero values, the application is activated after the specified timer value expires.
Application Button Priority	This parameter specifies the priority of the Application Button relative to all other tasks on the phone. If set to Low, then the Application Button only works when the phone is idle and on the main screen. If set to Medium, then the Application Button takes precedence over all tasks on the phone except when the phone keypad is locked. If set to High, then the Application Button takes precedence over all tasks on the phone even if the phone keypad is locked.
Emergency Numbers	This parameter specifies the emergency numbers that can be dialed without unlocking the phone keypad. For example, in the United States, the 911 emergency number is a good candidate so that it can be dialed without unlocking the phone. To specify more than one number, use a comma as separator. For example, if you want to enter 411, 511, and 911 as emergency numbers, then enter 411,511,911 in the field without spaces.
Dialing Mode	This parameter controls the behavior of the "Send" (green) key when it is pressed. If On-hook Dialing is selected, then the phone will remain on-hook. If Off-hook Dialing is selected, then phone sends an off-hook message.
Power Off in Multicharger	This parameter specifies whether the phone should power off when it is placed in a Multicharger or not.
Background Image	This parameter specifies the default wallpaper file. The administrator controls access to the phone's wallpaper list.
Home Screen	This parameter sets the phone's default home screen to Application View or Line View.
Local Contacts Access	This parameter enables or disables access to Local Contacts.
Favorites Access	This parameter enables or disables access to Favorites.
Voicemail Access	This parameter enables or disables access to Voicemail.
Applications Access	This parameter enables or disables access to Applications.
Recording Tone	This parameter can be used to configure whether the recording tone is enabled or disabled on the phone. If enabled, the phone mixes the recording tone into both directions for every call.
Recording Tone Local Volume	This parameter can be used to configure the volume of the recording tone that the local party hears. This volume applies regardless of the actual device used for hearing (handset, speakerphone, headset). The volume should be in the range of 0% to 100%, with 0% being no tone and 100% being at the same level as the current volume setting. The default value is 20%.
Recording Tone Remote Volume	This parameter can be used to configure the volume of the recording tone that the remote party hears. The volume should be in the range of 0% to 100%, with 0% being less than -66dBm and 100% being -4dBm. The default value is -10dBm or 50%.
Recording Tone Duration	This parameter specifies the length of time in milliseconds for which the recording tone is inserted in the audio stream. The default for this parameter is set to the value in the Network locale file for this field. The valid range for this

	parameter is a value between 1 and 3000 milliseconds.
Remote Log	This parameter specifies where to send the log data by serviceability. If enabled, the log data will be copied by serviceability to the place specified by Log Server/IPV6 Log Server. If disabled, the log data will not be copied by serviceability to the place specified by Log Server/IPV6 Log Server.
Log Profile	This parameter specified the pre-defined logging profile.
Log Server	This parameter specifies an IP address and port of a remote system where log messages are sent. The format is:xxx.xxx.xxx.xxx:ppppp@@options. Options will be format as base=x;pfs=y; base value range is 0~7,pfs value range is 0~1. And the two parameters are optional. Absence of pfs or base, pfs will be set to the default value 0 and base will be set to the default value 7.
IPv6 Log Server	This parameter specifies an IPv6 address and port of a remote system where log messages are sent. The format is:[xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx]:ppppp@@options. Options will be format as base=x;pfs=y; base value range is 0~7,pfs value range is 0~1. And the two parameters are optional. Absence of pfs or base, pfs will be set to the default value 0 and base will be set to the default value 7.
Cisco Discover Protocol (CDP)	This parameter allows the administrator to enable or disable Cisco Discovery Protocol (CDP).
SSH Access	This parameter specifies whether the phone will accept SSH connections. Disabling SSH Access will prevent access to the phone via SSH.
Ring Locale	This parameter specified the ring cadence. The phone has distinctive ring for On-net/Off-net or line based, but its ring cadence is fixed, and it is based on US standard only. Ring cadence in US standard is opposite to Japan standard. To support Japan ring cadence, the ring cadence should be configurable according to Ring Locale.
TLS Resumption Timer	This parameter specifies the maximum session resumption time allowed. The current TLS session to support TLS session resumption is HTTPS client. The HTTPS client sessions support configurable session resumption timer. If the value is set to 0, TLS session resumption will be disabled.
FIPS Mode	This parameter specifies if FIPS mode is enabled or disabled.
Record Call Log From Shared Line	This parameter specifies whether to record call log from shared line or not.
Minimum Ring Volume	This parameter controls the minimum ring volume on the phone. This value is set by the administrator, and can not be changed by an end user. The end user can increase the ring volume, but may not decrease the ring volume below the level defined. The minimum ring volume range is from 0 to 15, with 0 (silent) being the default value.
Load Server	This parameter specifies that the phone will use an alternative server to obtain firmware loads and upgrades, rather than the defined TFTP server. This option enables you to indicate a local server to be used for firmware upgrades, which can assist in reducing install times, particularly for upgrades over a WAN. Enter the hostname or the IP address (using standard IP addressing format) of the server. The indicated server must be running TFTP services and have the load file in the TFTP path. If the load file is not found, the load will not install. The phone will not be redirected to the TFTP server. If this field is left blank, the phone will

	use the designated TFTP server to obtain its load files and upgrades.
IPv6 Load Server	This parameter specifies that the phone will use an alternative IPv6 server to obtain firmware loads and upgrades, rather than the defined TFTP server. This option enables you to indicate a local IPv6 server to be used for firmware upgrades, which can assist in reducing install times, particularly for upgrades over a WAN. Enter the hostname or the IPv6 address (using standard IPv6 addressing format) of the server. The indicated server must be running TFTP services and have the load file in the TFTP path. If the load file is not found, the load will not install. The phone will not be redirected to the TFTP server. If this field is left blank, the phone will use the designated TFTP server to obtain its load files and upgrades.
WLAN SCEP Server	This parameter specifies the SCEP Server the phone will use to obtain certificates for WLAN authentication. Enter the hostname or the IP address (using standard IP addressing format) of the server.
WLAN Root CA Fingerprint (SHA256 or SHA1)	This parameter specifies the SHA256 or SHA1 fingerprint of the Root CA to use for validation during the SCEP process when issuing certificates for WLAN authentication. It is recommended to utilize the SHA256 fingerprint, which can be obtained via OpenSSL (e.g. openssl x509 -in rootca.cer -noout -sha256 -fingerprint) or using a Web Browser to inspect the certificate details. Enter the 64 hexadecimal character value for the SHA256 fingerprint or the 40 hexadecimal character value for the SHA1 fingerprint with a common separator (colon, dash, period, space) or without a separator. If using a separator, then the separator should be consistently placed after every 2, 4, 8, 16, or 32 hexadecimal characters for a SHA256 fingerprint or every 2, 4, or 8 hexadecimal characters for a SHA1 fingerprint.
Console Access	This parameter specifies whether the serial console is enabled or disabled.
Gratuitous ARP	This parameter specifies whether the phone will learn MAC addresses from Gratuitous ARP responses. Disabling the phones ability to accept Gratuitous ARP will prevent applications which use this mechanism for monitoring and recording of voice streams from working. If monitoring capability is not desired, disable this parameter.
Show All Calls On Primary Line	This parameter specifies whether all calls presented to this device will be shown on the primary line or not.
Advertise G.722 and iSAC Codecs	This parameter specifies whether the phone will advertise the G.722 codec or not. Codec negotiation involves two steps: first, the phone must advertise the supported codec(s) to the Cisco Unified CallManager (not all endpoints support the same set of codecs). Second, when the Cisco Unified CallManager gets the list of supported codecs from all phones involved in the call attempt, it chooses a commonly-supported codec based on various factors, including the region pair setting. The options are Use System Default (this phone will defer to the setting specified in the enterprise parameter, Advertise G.722 Codec), Disabled (this phone will not advertise G.722 support), and Enabled (this phone will advertise G.722 support).
Detect Unified CM Connection Failure	This parameter determines the sensitivity that the phone has for detecting a connection failure to Cisco Unified Communications Manager (Unified CM), which is the first step before device failover to a backup Unified CM/SRST occurs. Valid values specify Normal (detection of a Unified CM connection failure occurs at the standard system rate) or Delayed (detection of a Unified CM connection failover occurs approximately four times slower than Normal). For

	<p>faster recognition of a Unified CM connection failure, choose Normal. If you prefer failover to be delayed slightly to give the connection the opportunity to reestablish, choose Delayed. Note that the precise time difference between Normal and Delayed connection failure detection depends on many variables that are constantly changing. This only applies to the wired Ethernet connection.</p>
Simplified New Call UI	<p>This parameter specifies whether to use simplified call UI style when the phone is off-hook or not. Those who like the New Call Window can continue to use that at the same time that those who prefer the simplified new call Session can use that method.</p>
Revert to All Calls	<p>This parameter specifies whether the phone will revert to All Calls after any call is ended or not if the call is on a filter other than Primary line, All Calls, or Alerting Calls.</p>
DF Bit	<p>This parameter configures the DF bit in IP header.</p>
Lowest Alerting Line State Priority	<p>This parameter specifies the alert state when using shared lines. When disabled and there is an incoming call alerting on the shared line, the LED/Line state icon will reflect the alerting state instead of Remote-In-Use. When enabled, will see the Remote-In-Use state when there is call alerting on the shared line.</p>

XML Syntax

To configure product specific configuration options for the Cisco Wireless IP Phone 8821 and 8821-EX with Cisco Unified Communications Manager Express, add the necessary options under **telephony-service**.

service phone <module> <value>

<u>Field Name</u>	<u>Module</u>	<u>Value</u>

Configuring the Cisco Wireless IP Phone 8821 and 8821-EX

Wi-Fi Profile Configuration

To configure the Wi-Fi settings on the Cisco Wireless IP Phone 8821 and 8821-EX, either use the desktop charger or default Wi-Fi profile to connect to a Cisco Unified Communications Manager, use the phone's admin webpage interface, or use the local user interface and keypad.

Automatic Provisioning

For automatic provisioning of the Wi-Fi Profiles, the Cisco Wireless IP Phone 8821 and 8821-EX needs to be connected to a network either while docked with a supported USB to Ethernet dongle connected in the back of the dock or using the default Wi-Fi settings (**SSID = cisco** and **Security Mode = None**), which has connectivity to the Cisco Unified Communications Manager.

The Voice VLAN feature is supported as of the 11.0(3) release, but was not in previous releases so the native VLAN was utilized.

The VLAN of the switch port in which the USB to Ethernet dongle is connected to (Voice VLAN if enabled) must have connectivity to the CUCM and that VLAN must offer DHCP option 150 pointing it to the CUCM.

Wired 802.1x authentication and DHCP snooping features are not supported when using the USB to Ethernet dongle, so need to ensure the switchport is configured properly.

Use of a supported USB to Ethernet dongle is for initial provisioning purposes only and not to convert the Cisco Wireless IP Phone 8821 or 8821-EX to a wired IP phone. Voice calls over Ethernet are not supported.

The following USB to Ethernet dongles are supported.

- Apple USB 2.0 Ethernet Adapter (www.apple.com)

- Belkin B2B048 USB 3.0 Gigabit Ethernet Adapter (www.belkin.com)
- D-Link DUB-E100 USB 2.0 Fast Ethernet Adapter (www.dlink.com)
- Linksys USB3GIG USB 3.0 Gigabit Ethernet Adapter (www.linksys.com)
- Linksys USB300M USB 2.0 Ethernet Adapter (www.linksys.com)

With connectivity to a Cisco Unified Communications Manager 10.0 or later, Wi-Fi profile configuration data can be downloaded and applied to the Cisco Wireless IP Phone 8821 and 8821-EX.

Cisco Unified Communications Manager 11.0 or later is required if wanting to download and apply a Wi-Fi profile including EAP-TLS authentication.

For more information, see the **Cisco Unified Communications Manager > Wireless LAN Profiles** section.

Certificates can also be automatically installed utilizing a network connection.

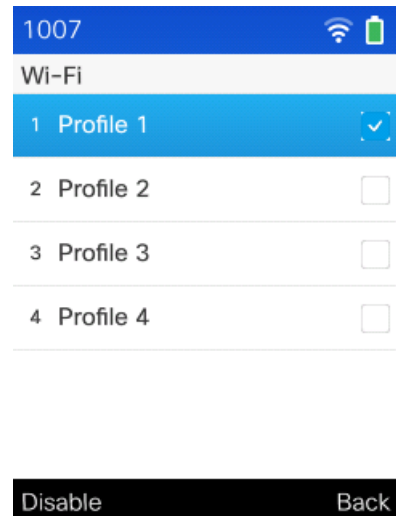

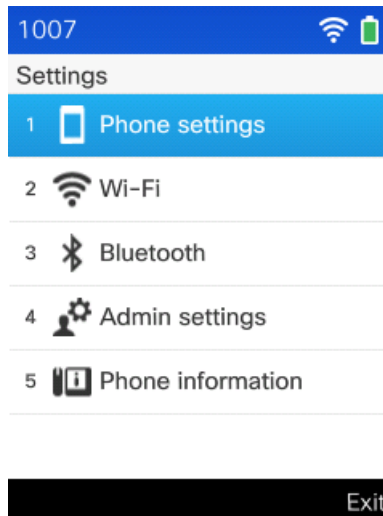

For more information, see the **Simplified Certificate Enrollment Protocol (SCEP)** section.

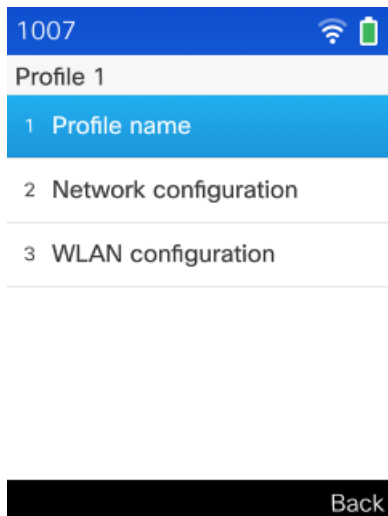

Local User Interface

Use the following guidelines to configure the Wi-Fi Profiles via the local keypad.

- Use the 5-way navigation button to navigate to **Settings > Wi-Fi**, then select the desired profile to configure.
- Up to 4 Wi-Fi profiles can be configured.

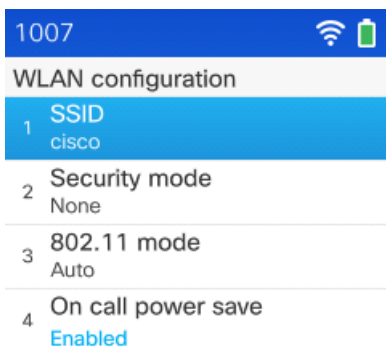

- Then select either **Profile name**, **Network configuration**, or **WLAN configuration** using the 5-way navigation button.

- **Profile name** configuration is optional, but if selected, then can enter a custom name.
- Select **Save** under ... to save the changes or **Cancel** under ... to dismiss the changes.
- Defaults to **Profile 1**, **Profile 2**, **Profile 3**, **Profile 4**.

- Select **WLAN configuration** to configure the WLAN parameters including **SSID**, **Security mode**, **802.11 mode**, and **On call power save**.
- Press the 5-way navigation's middle button to toggle an option and to enter edit mode.
- Only Profile 1 is **Enabled** by default.
- Only Profile 1's **SSID** defaults to **cisco**; others are null.
- All profiles default to **Security mode = None**, **802.11 mode = Auto**, and **On call power save = Enabled**.

- Select **SSID** then enter the SSID for the desired WLAN.
- Select **Save** under ... to save the changes or **Cancel** under ... to dismiss the changes.

- Below lists the available security modes supported and the key management and encryption types that can be used for each mode.

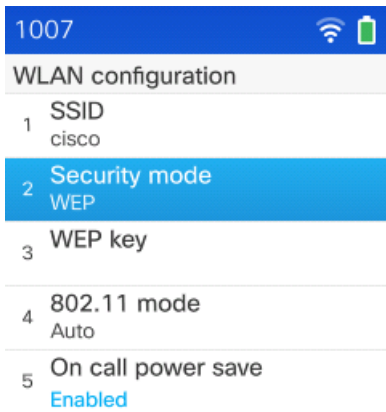

Security Mode	802.1x Type	Key Management	Encryption
None	N/A	None	None
WEP	N/A	Static	WEP
PSK	N/A	WPA2, WPA	AES, TKIP
EAP-FAST	EAP-FAST	WPA2, WPA	AES, TKIP
EAP-TLS	EAP-TLS	WPA2, WPA	AES, TKIP
PEAP-GTC	PEAP-GTC	WPA2, WPA	AES, TKIP
PEAP-MSCHAPv2	PEAP-MSCHAPv2	WPA2, WPA	AES, TKIP

- To utilize open security, set **Security mode** = **None**.
- Select **Save** to save the changes or **Cancel** to dismiss the changes.

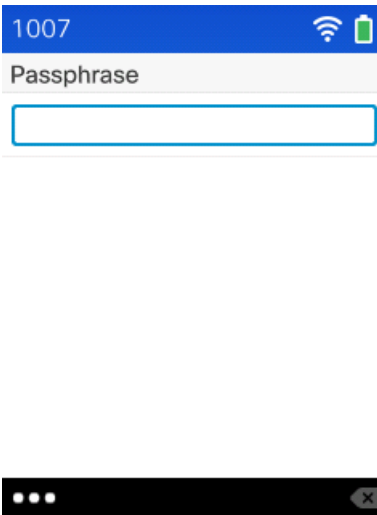

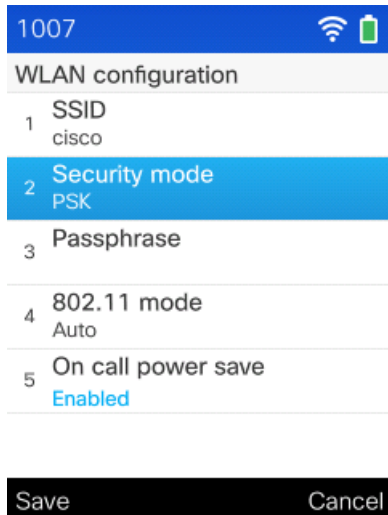

- To utilize WEP security, set **Security mode** = **WEP** then enter the 40/104 or 64/128 ASCII or HEX **WEP key**.
- Only key index 1 is supported, so will want to ensure that only key index 1 is configured on the access point.
- Select **Save** to save the changes or **Cancel** to dismiss the changes.

Key Style	Key Size	Characters
ASCII	40/64 bit	5
ASCII	104/128 bit	13
HEX	40/64 bit	10 (0-9, A-F)
HEX	104/128 bit	26 (0-9, A-F)

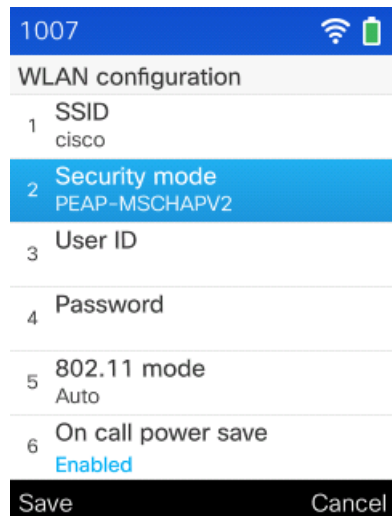

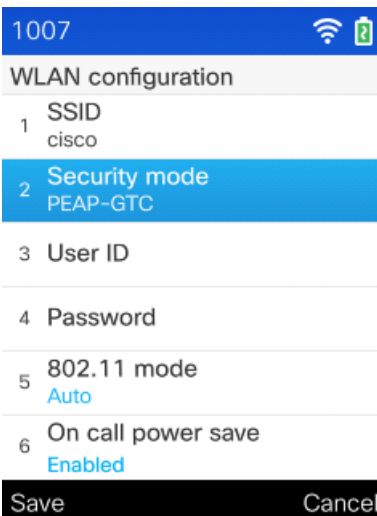

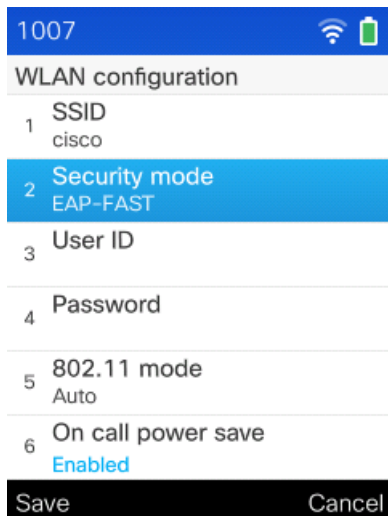

- To utilize PSK security, set **Security mode** = **PSK** then enter the 8-63 ASCII or 64 HEX **Passphrase**.
- Select **Save** to save the changes or **Cancel** to dismiss the changes.

Key Style	Characters
ASCII	8-63
HEX	64 (0-9,A-F)

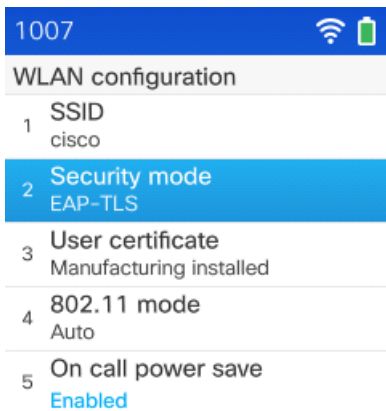

- To utilize **EAP-FAST**, **PEAP-GTC**, or **PEAP-MSCHAPv2**, set the **Security mode** accordingly, then the **User ID** and **Password** must be configured.
- The root CA certificate of the CA chain that issues the RADIUS server certificates can optionally be installed either via SCEP, manually via the admin webpage, or via TFTP download if wanting to enable server validation. Server validation is automatically enabled once a server certificate is installed.
- Select **Save** to save the changes or **Cancel** to dismiss the changes.

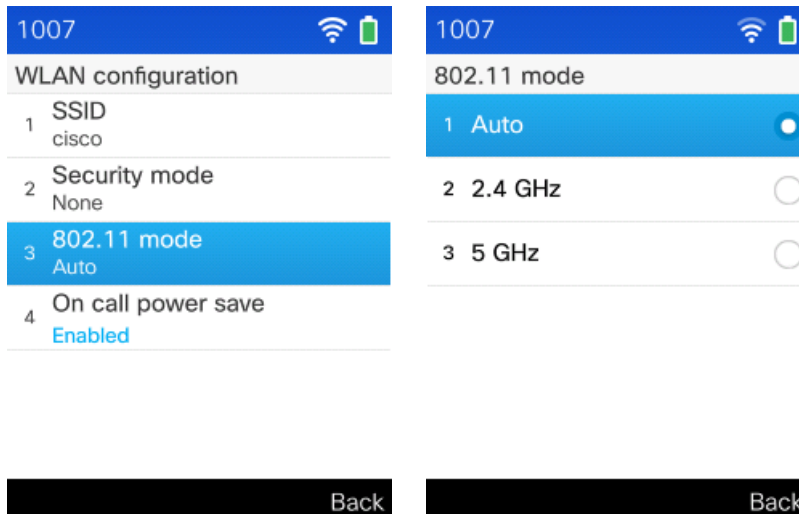

- If selecting EAP-TLS as the security mode, then must configure the type of user certificate to use.
If **User installed** is selected, then will need to have a user certificate installed either manually via the admin webpage or via SCEP.
- Select **Save** to save the changes or **Cancel** to dismiss the changes.
- The root CA certificate of the CA chain that issues the RADIUS server certificates can optionally be installed to enable server validation when using EAP-TLS. Server validation is automatically enabled once a server certificate is installed.

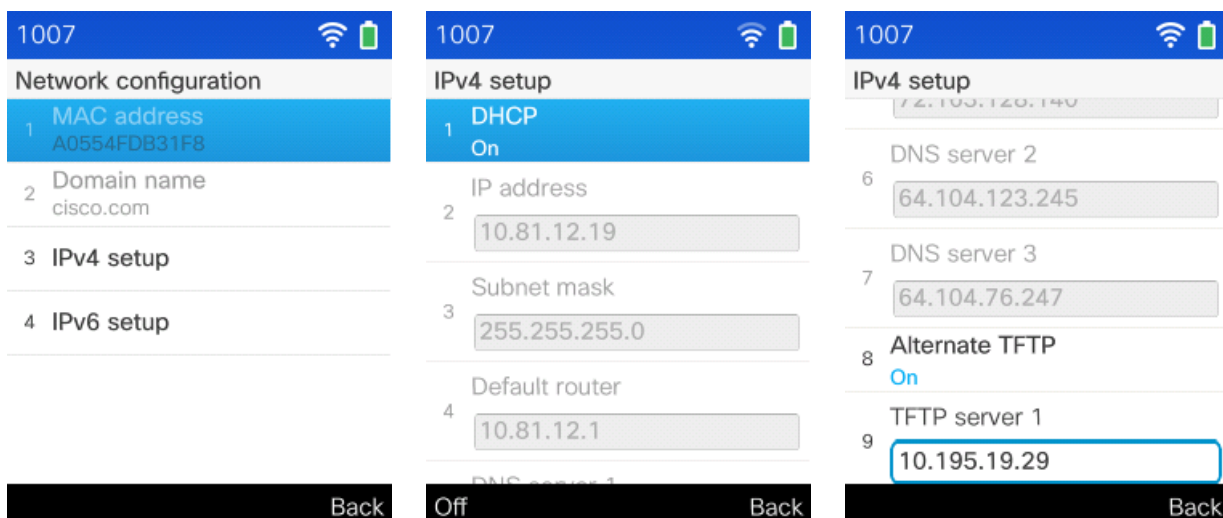

- Select one of the following 802.11 modes to set the frequency band, then **Save**.
 - Auto
 - 2.4 GHz
 - 5 GHz
- **Auto** mode (default mode) will scan both 2.4 GHz and 5 GHz channels, but will give preference to the 5 GHz frequency band.
- **2.4 GHz** mode will only scan 2.4 GHz channels and **5 GHz** mode will only scan 5 GHz channels, then will attempt to associate to an available access point.

- It is recommended to set the frequency band on the Cisco Wireless IP Phone 8821 and 8821-EX to 5 GHz when wanting to utilize the 5 GHz frequency band only, which prevents scanning and potentially roaming to the 2.4 GHz frequency band.
- Select **Save** to save the changes or **Cancel** to dismiss the changes.

- If **Network configuration** is selected, then can configure IP settings including DHCP and Alternate TFTP.
- Press the 5-way navigation's middle button to toggle an option or to enter edit mode.
- If option 150 or 66 is not configured to provide the TFTP Server's IP address via the network's DHCP scope, then set **Alternate TFTP** to **On** and enter the IP address for the TFTP Server.
- Select **Save** to save the changes or **Cancel** to dismiss the changes.
- Ensure to select **Erase** if prompted, when configuring Alternate TFTP.

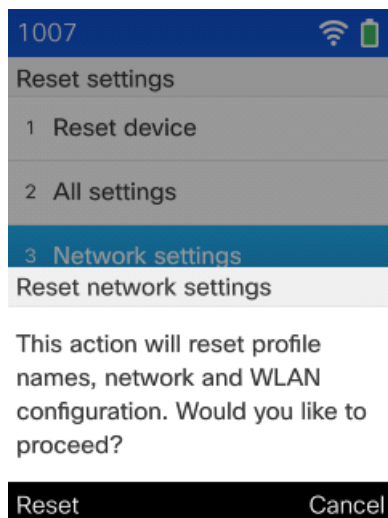

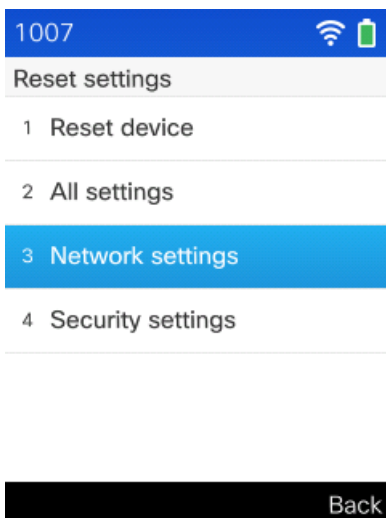

- **On call power save** defaults to **Enabled**.
- When **Enabled**, the phone will utilize U-APSD when on call.
- This parameter does not alter power save when in idle as the phone will always utilize U-APSD when not on call.
- **On call power save** should only be set to **Disabled** if required for troubleshooting purposes.

- Select **Save** to save the changes or **Cancel** to dismiss the changes.

- The current network settings can be cleared by selecting **Applications > Admin settings > Reset settings > Network settings**.

Note: 802.11r (FT) or CCKM will be negotiated if enabled on the access point when using EAP-FAST, EAP-TLS, PEAP-GTC, or PEAP-MSCHAPv2, where preference is given to 802.11r (FT).

The access point must support AES as TKIP can only be used as the broadcast/multicast cipher.

WEP128 is listed as WEP104 on the Cisco Wireless LAN Controllers.

For more information, refer to the Cisco Wireless IP Phone 8821 Series Administration Guide at this URL:

<https://www.cisco.com/c/en/us/support/collaboration-endpoints/unified-ip-phone-8800-series/products-maintenance-guides-list.html>

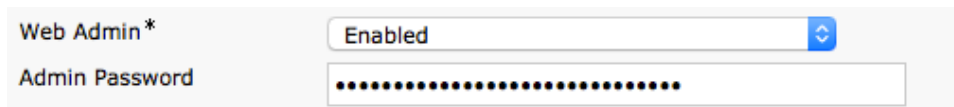

Admin Webpage

The admin webpage interface for the Cisco Wireless IP Phone 8821 and 8821-EX can be accessed via Wi-Fi or USB.

- For the Wi-Fi method, the phone is defaulted with SSID = cisco and Security Mode = None.
- For the USB method, ensure the phone is connecting to a Windows 7, 8, 10 or Mac OS X computer. A driver is not required for Windows but is required for Mac OS X (<http://joshuawise.com/horndis>). Then set a static IP address for the network interface created on the computer (e.g. 192.168.1.101 /24 as the phone uses 192.168.1.100 /24).

Use the following guidelines to configure the Wi-Fi Profiles via the phone's admin webpage interface.

- Browse to <https://x.x.x.x:8443> when **Web Admin** is **Enabled** and **Admin Password** has been defined. For out of box / factory reset, **Web Admin** is enabled temporarily, but may get disabled once the phone registers to Cisco Unified Communications Manager as Web Admin is Disabled by default in Cisco Unified Communications Manager.

The screenshot shows a web form with two fields. The first field is labeled "Web Admin*" and has a dropdown menu set to "Enabled". The second field is labeled "Admin Password" and contains a series of black dots representing a masked password.

- Enter **admin** as the **Username** and the string defined for the **Admin Password** for **Password**, then select Submit. For out of box / factory reset, the Admin Password is temporarily set to **Cisco**.

	Sign in
<h2 style="margin: 0;">User sign in</h2> <p style="margin: 0;">Cisco IP Phone CP-8821 (SEPA0554FDB31F8)</p>	
<ul style="list-style-type: none"> Device information Network setup Setup <ul style="list-style-type: none"> WLAN Certificates Backup settings Network statistics <ul style="list-style-type: none"> Network Device logs <ul style="list-style-type: none"> Console logs Core dumps Status messages Debug display Streaming statistics <ul style="list-style-type: none"> Stream 1 Stream 2 Stream 3 Stream 4 Stream 5 System <ul style="list-style-type: none"> Date and time Restart 	<p>Username <input type="text"/></p> <p>Password <input type="password"/></p> <p style="text-align: center;"><input type="button" value="Submit"/></p>

- To create a configuration file to be used for all Cisco Wireless IP Phone 8821 and 8821-EX, browse to the admin webpage of the out of box or factory defaulted Cisco Wireless IP Phone 8821 or 8821-EX.
- Select **WLAN** menu option then configure the necessary profiles where the SSID, 802.11 Mode, Security Mode, etc. must be specified.
- For EAP-TLS, the **User Certificate** can be set to **User Installed** or **Manufacturing Installed** (will be defaulted to **Manufacturing Installed**).
- For PEAP with Server Validation or EAP-TLS, upload the **Server (Root CA) Certificate**.
- The **Server (Root CA) Certificate** does not need to be configured at the WLAN Profile level.

- Once the Wi-Fi Profile configuration is complete, the configuration can be exported by selecting **Backup Settings** menu option.
- Prior to selecting **Export**, enter an **Encryption Key** (8-127characters) to encrypt the export template.
- Save the file to the local PC after selecting **Export** for later use.
- Any pre-existing **Server (Root CA) Certificates** will be included in the exported configuration.

- To apply the exported configuration file, select **Backup Settings** on the phone’s admin webpage.

- Prior to selecting **Import**, browse to the template to be applied and enter the **Encryption Key** that was specified during the template export process previously.
- The Cisco Wireless IP Phone 8821 and 8821-EX will need to be restarted after the template is uploaded.

Bulk Deployment Utility

The Bulk Deployment Utility (BDU) for the Cisco Wireless IP Phone 8821 and 8821-EX can be utilized for initial deployment or after the phones have been deployed.

The BDU provides quick provisioning and deployment when unique 802.1x accounts are used with EAP-FAST, PEAP-GTC, or PEAP-MSCHAPV2 or when a common set of credentials are used by all phones (e.g. PSK or a single 802.1x account).

A personal computer running Microsoft Windows or Apple OS X with Java installed is required. Java can be downloaded at <https://java.com/en/download>.

The BDU requires firmware version 11.0(3)SR4 or later for the Cisco Wireless IP Phone 8821 and 8821-EX.

The BDU does not support certificate provisioning, however the phones can download certificates via Simple Certificate Enrollment Protocol (SCEP) or be manually installed via the phone's admin webpage interface (<https://x.x.x.x:8443>), where x.x.x.x is the IP address of the phone. You can also place a Root CA certificate on the TFTP Server (named **WLANRootCA.cer**), which automatically downloads to the phone.

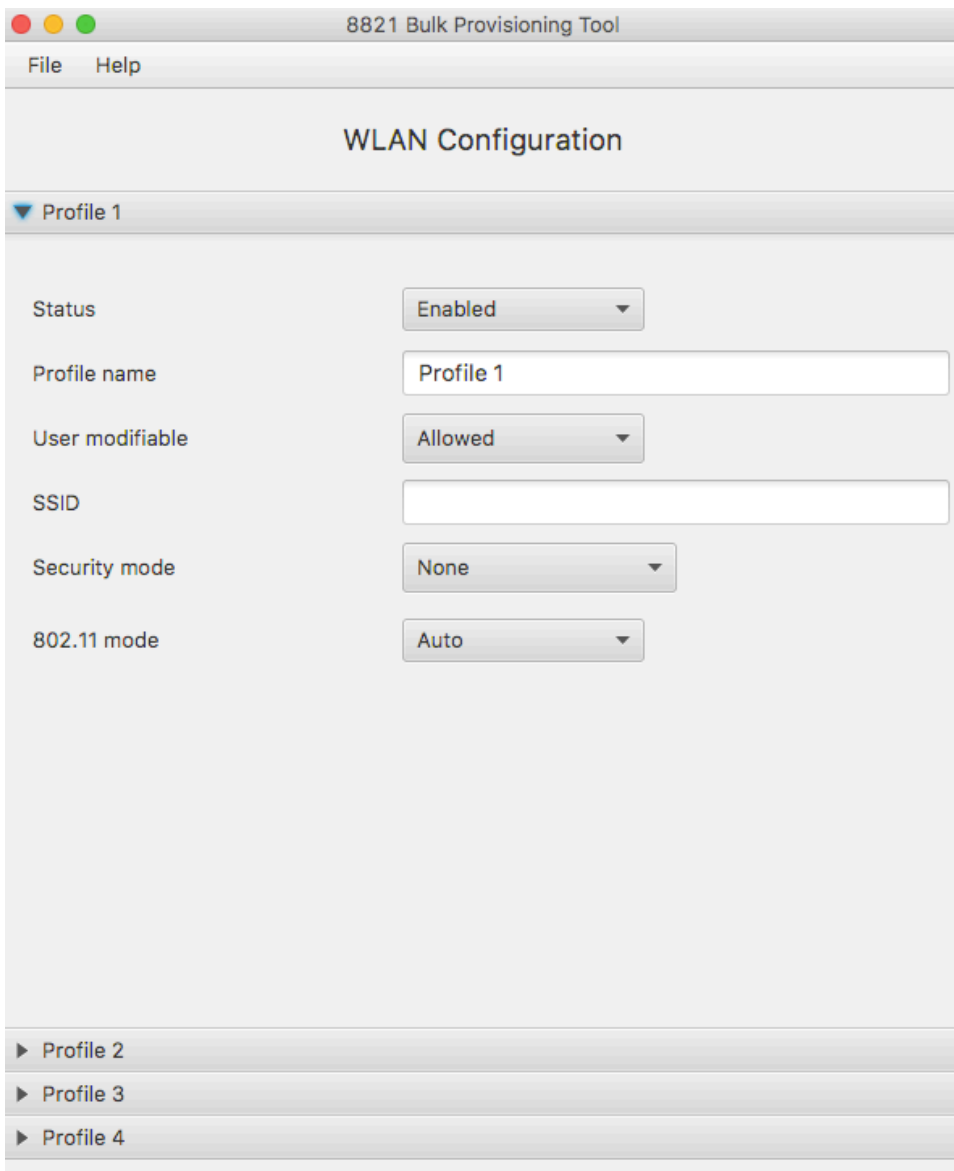

Create Wi-Fi Profiles

Once **882xBD.1-0.jar** is downloaded from Cisco.com, double-click the file to launch the BDU.

Prior to exporting TFTP downloadable configuration file(s), the Wireless LAN configuration parameters must be specified.

1. Configure the **Status** per Wi-Fi profile as necessary.
 - **Enabled** (Profile 1 is enabled by default)
 - **Disabled** (Profiles 2-4 are disabled by default)
2. Configure the **Profile name** per Wi-Fi profile as necessary.
 - A string with up to 32 characters is allowed.
3. Configure **User modifiable** per Wi-Fi profile as necessary.
 - **Allowed** = The user has the capability to change any Wireless LAN settings (e.g. Enable/Disable, SSID, Frequency Band, Authentication Method, Username and Password, PSK Passphrase, WEP Key) locally on the endpoint.
 - **Disallowed** = The user is unable to change any Wireless LAN settings.
 - **Restricted** = The user is only able to change certain Wireless LAN settings (e.g. User ID and Password)
4. Configure the **SSID** per Wi-Fi profile as necessary.
 - A string with up to 32 characters is allowed.
5. Configure the **Security mode** per Wi-Fi profile as necessary.
 - **None**
 - **WEP**
 - Requires **WEP key** to be entered.
 - **PSK**
 - Requires **Passphrase** to be entered.
 - **EAP-FAST**

- Requires **User ID** and **Password** to be populated either automatically via CSV file or manually.
 - Check **Provide shared credentials** to manually specify the **User ID** and **Password**.
 - Uncheck **Provide shared credentials** to use a CSV file to specify the **User ID** and **Password**.
 - **EAP-TLS**
 - Requires **User certificate** to be set to either **Manufacturing installed** or **User installed**.
 - **PEAP-GTC**
 - Requires **User ID** and **Password** to be populated either automatically via CSV file or manually.
 - Check **Provide shared credentials** to manually specify the **User ID** and **Password**.
 - Uncheck **Provide shared credentials** to use a CSV file to specify the **User ID** and **Password**.
 - **PEAP-MSCHAPV2**
 - Requires **User ID** and **Password** to be populated either automatically via CSV file or manually.
 - Check **Provide shared credentials** to manually specify the **User ID** and **Password**.
 - Uncheck **Provide shared credentials** to use a CSV file to specify the **User ID** and **Password**.
6. Configure the **802.11 mode** per Wi-Fi profile as necessary.
- **Auto** = Gives priority to 5 GHz frequencies over 2.4 GHz frequencies.
 - **2.4 GHz** = Uses 2.4 GHz frequencies only.
 - **5 GHz** = Uses 5 GHz frequencies only.

Note: If you plan to use unique 802.1x accounts with the Bulk Export method, the username and password do not need to be specified; they will be specified in the CSV file.

The BDU does not support static IP addresses, therefore DHCP (including TFTP) is used.

Export Configuration Files

Once the Wireless LAN configuration parameters are specified, then the TFTP downloadable configuration file(s) can be exported by selecting **File > Export** from the BDU.

There are two methods for exporting configuration files (**Bulk Export** and **Default Export**), which is auto-determined based on the selected security mode and whether unique credentials are specified or not.

If you need to deploy the phones with unique 802.1x accounts utilizing EAP-FAST, PEAP-GTC, or PEAP-MSCHAPV2, then the **Bulk Export** method is selected automatically.

If you need to deploy the phones with identical wireless LAN settings (e.g. None, WEP, PSK, EAP-TLS, or single user account with EAP-FAST, PEAP-GTC, PEAP-MSCHAPV2), then the **Default Export** method is selected automatically.

Bulk Export

The Bulk Export method uses the common Wireless LAN configuration parameters specified when creating the template, and prompt for a CSV file, which will contain the phone MAC address, username, and password.

A sample CSV file (**userinfo.csv**), available at **Help > Userinfo template export**, can be used as a template.

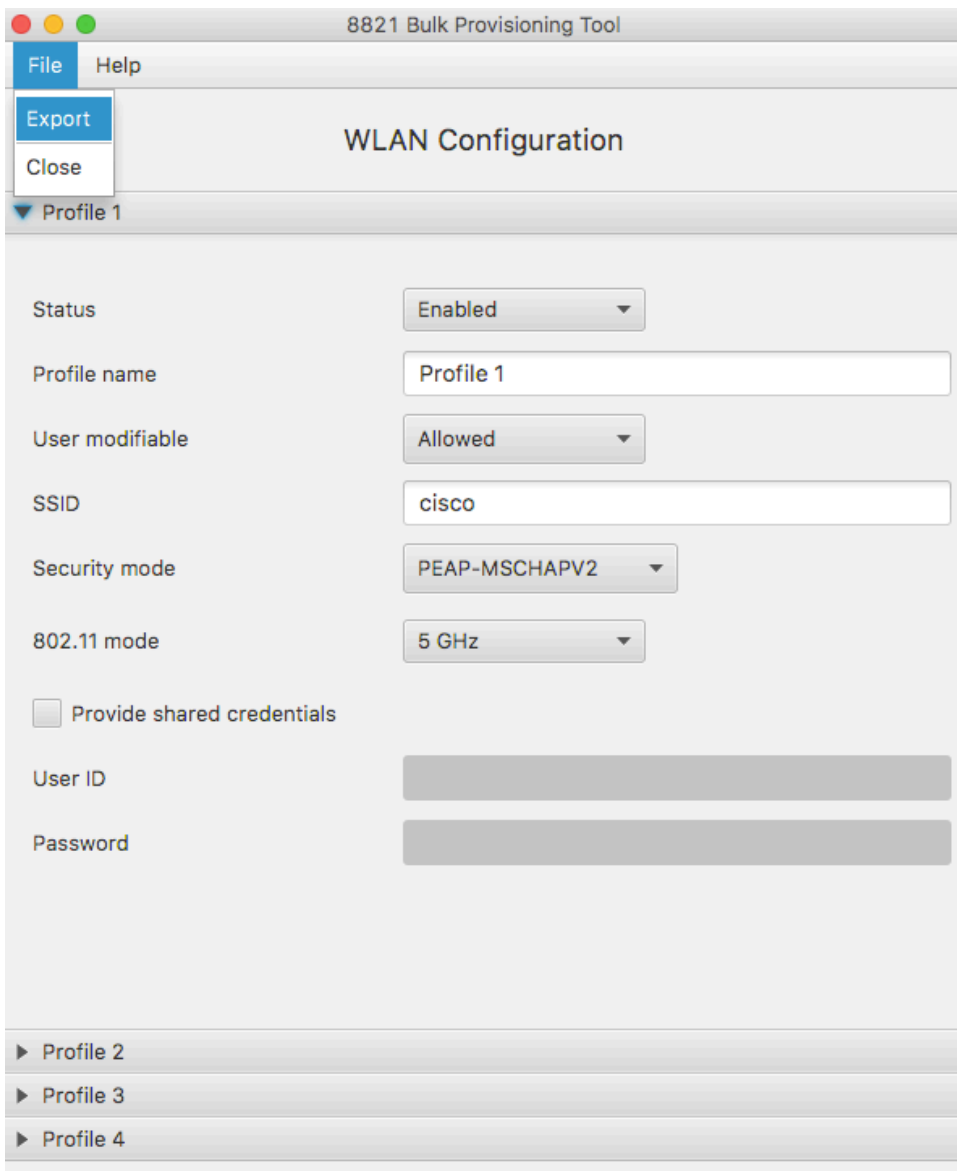

Below is the file format for the **userinfo.csv** file.

```
MAC,Username,Password
00EBD5DB019C,Joe,Lee
```

Up to 5,000 entries are supported per CSV file.

After the CSV file is imported, TFTP downloadable configuration files for each phone are automatically created and exported to the location specified.

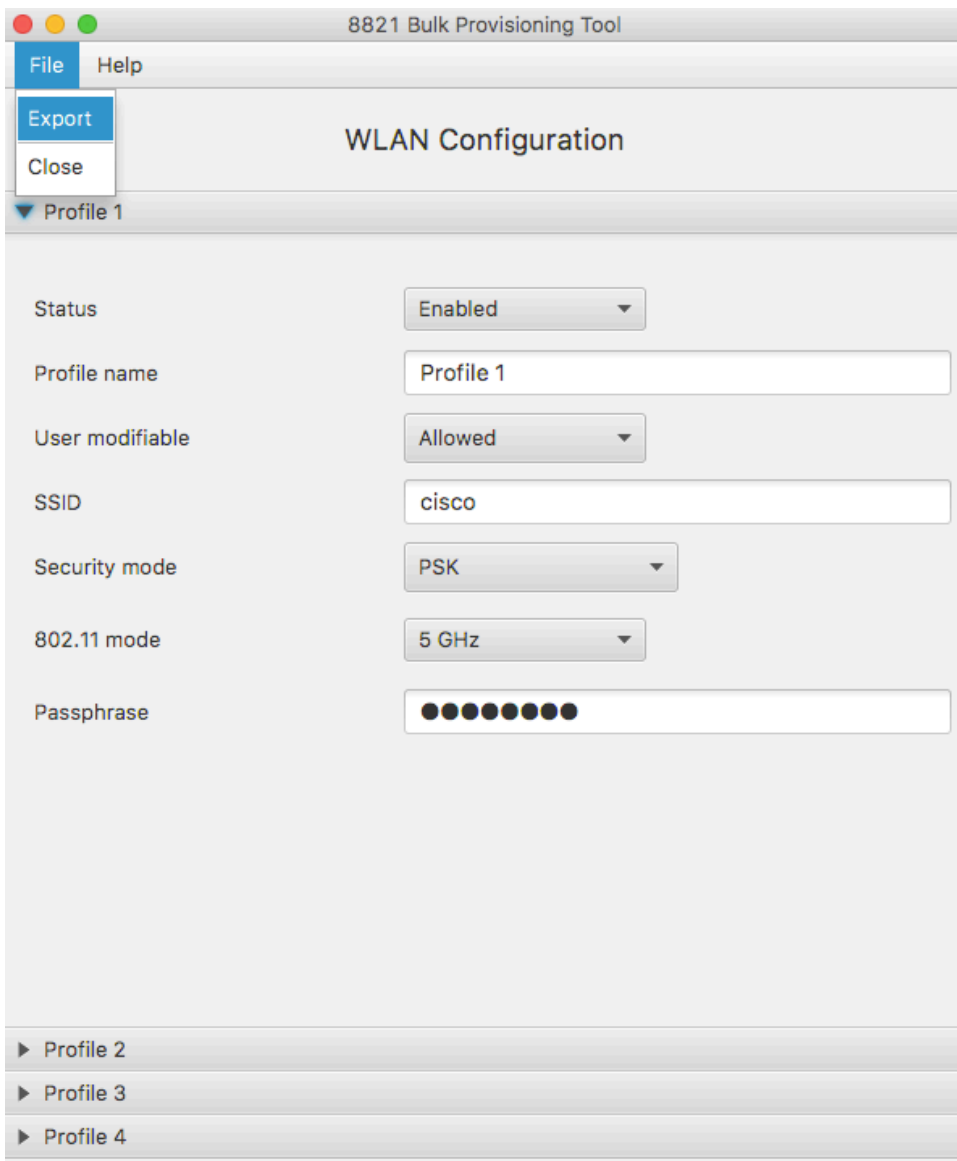

The exported file names are in the format of **8821-WLAN<MAC>.xml**, which the phone attempts to TFTP download when the phone is powered on or re-provisions.

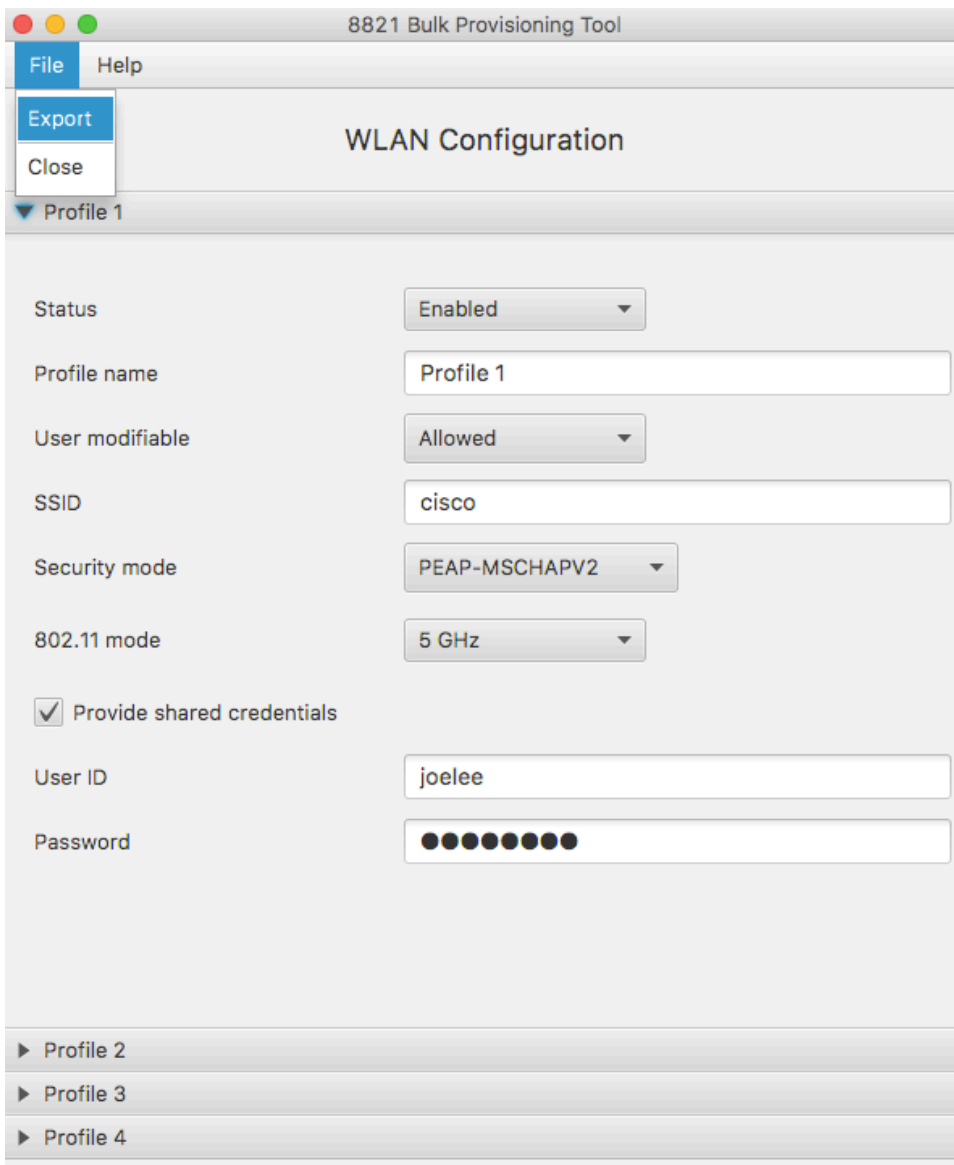

Default Export

The Default Export method uses the common Wireless LAN configuration parameters specified when creating the template and a TFTP downloadable configuration file will be automatically created and exported to the location specified.

The exported file name will be **8821-WLANDefault.xml**, which the phone attempts to TFTP download when the phone is powered on or re-provisions.

Push Configuration Files to the Cisco 8821 and 8821-EX

The BDU does not have TFTP server capabilities, therefore either the TFTP server on Cisco Unified Communications Manager / Cisco Unified Communications Manager Express or a third-party TFTP server will be required to host the phone configuration files once exported.

For initial deployment, use one of the following methods:

- Connect the phone to an Ethernet network while docked with a supported USB to Ethernet dongle connected to obtain IP settings via DHCP (including TFTP server) where the phone can TFTP download the phone configuration file.
- Connect the phone to a wireless LAN using the default SSID (cisco) to obtain IP settings via DHCP (including TFTP server) where the phone can TFTP download the phone configuration file.

For post-deployment, where phones are already being utilized on the production wireless LAN, copy the phone configuration files to the TFTP server that the phones are pointed to, then reset the phones to reconnect to the production wireless LAN. The phone then attempts to TFTP download the phone configuration file. The TFTP service may need to be restarted prior to resetting the phones depending on which type of TFTP server is utilized.

After the phone receives the configuration file, the phone will re-provision with the new settings and attempt to join the intended wireless LAN.

If currently docked with an active USB to Ethernet connection, the phone attempts to join the wireless LAN once undocked.

Certificate Management

The Cisco Wireless IP Phone 8821 and 8821-EX can utilize X.509 digital certificates for EAP-TLS or to enable Server Validation when using PEAP-GTC or PEAP-MSCHAPV2.

A User Certificate can be installed either automatically via Simple Certificate Enrollment Protocol (SCEP) or manually via the phone's admin webpage interface (<https://x.x.x.x:8443>).

A Server Certificate can be installed either automatically via Simple Certificate Enrollment Protocol (SCEP), manually via the phone's admin webpage interface (<https://x.x.x.x:8443>), or via TFTP download.

The TFTP download method can help when the RADIUS servers are issued certificates from a different CA chain than the CA chain used for issuing client certificates or if wanting to quickly enable Server Validation for PEAP.

To install a Server Certificate via the TFTP download method, rename the Root CA certificate to **WLANRootCA.cer** then copy it to the CUCM TFTP servers and restart the TFTP service for those CUCM servers.

Only 1 user certificate is allowed and up to 3 server certificates (1 per installed method; SCEP, manual, TFTP) are allowed.

Once a certificate is installed, Server Validation is automatically enabled if configured for EAP-TLS, PEAP-GTC, or PEAP-MSCHAPV2.

Microsoft® Certificate Authority (CA) servers are recommended. Other CA server types may not be completely interoperable with the Cisco Wireless IP Phone 8821 and 8821-EX.

Both DER and Base-64 (PEM) encoding are acceptable for the client and server certificates.

Certificates with a key size of 1024, 2048, and 4096 are supported.

Ensure the client and server certificates are signed using either the SHA-1 or SHA-256 algorithm, as the SHA-3 signature algorithms are not supported.

Ensure Client Authentication is listed in the Enhanced Key Usage section of the user certificate details.

Manual Installation

For out of box (factory reset) manual installation, the admin webpage interface is **Enabled**, the username is fixed to **admin**, and the password is temporarily set to **Cisco**.

The temporary password will no longer be available once the phone registers to Cisco Unified Communications Manager.

The admin webpage interface will be **Disabled** on the phone once it registers to Cisco Unified Communications Manager regardless if it contains support for the **Web Admin** and **Admin Password** options.

Once the phone has registered to CUCM, set **Web Admin** to **Enabled** in CUCM to enable the admin webpage interface. Then configure **Admin Password** by specifying a 8-127 character string. If wanting to keep the admin webpage interface access enabled long-term, then should utilize a secure profile with TFTP encryption enabled.

For out of box (factory reset), will need to ensure the date and time is configured correctly. Can set the **Date & Time** by syncing to the local machine or setting the **Date & Time** manually.

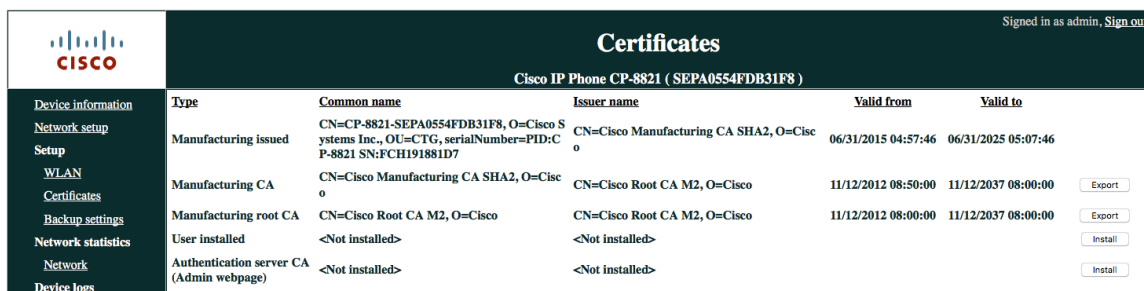

Can utilize either the internal Manufacturing Installed Certificate (MIC) or a custom User Installed certificate to be used as the User Certificate for EAP-TLS.

Manufacturing Installed Certificate (MIC)

The pre-installed Manufacturing Installed Certificate (MIC) can be used as the **User Certificate** for **EAP-TLS**.

The MIC's CA chain must be exported and added to the RADIUS server's trust list if wanting to use the **MIC** as the **User Certificate** for **EAP-TLS**.

Click **Export** to download the root and sub CA certificates from the admin webpage interface.

Type	Common name	Issuer name	Valid from	Valid to	
Manufacturing issued	CN=CP-8821-SEPA0554FDB31F8, O=Cisco Systems Inc., OU=CTG, serialNumber=PID:CP-8821 SN:FCH191881D7	CN=Cisco Manufacturing CA SHA2, O=Cisco	06/31/2015 04:57:46	06/31/2025 05:07:46	
Manufacturing CA	CN=Cisco Manufacturing CA SHA2, O=Cisco	CN=Cisco Root CA M2, O=Cisco	11/12/2012 08:50:00	11/12/2037 08:00:00	Export
Manufacturing root CA	CN=Cisco Root CA M2, O=Cisco	CN=Cisco Root CA M2, O=Cisco	11/12/2012 08:00:00	11/12/2037 08:00:00	Export
User installed	<Not installed>	<Not installed>			Install
Authentication server CA (Admin webpage)	<Not installed>	<Not installed>			Install

User Installed Certificate

To manually install a user certificate for **EAP-TLS**, select **Install** for **User Installed** on the main certificates webpage.

Select **Browse** to point to the user certificate in **PKCS #12** format (.p12 or .pfx).

Enter the **Extract password** (up to 12 characters), then select **Upload**.

Ensure the CA chain that issued the user certificate is added to the RADIUS server's trust list.

Select file (.p12 or .pfx) to upload: No file selected.

Extract password:

Will need to restart the Cisco Wireless IP Phone 8821 or 8821-EX after all certificates are installed.

User installed certificate has been updated.

Phone will use the new certificate after reboot. You can restart the phone with:

"System/Restart"

Server Certificate

The root CA certificate that issued the RADIUS server's certificate must be installed for **EAP-TLS** or to enable **Server Validation** for **PEAP-GTC** or **PEAP-MSCHAPV2**.

To manually install a server certificate, select **Install** for **Authentication Server CA** on the main certificates webpage. Select **Browse** to point to the server certificate with **PEM (Base-64)** or **DER** encoding.

Will need to restart the Cisco Wireless IP Phone 8821 or 8821-EX after all certificates are installed.

Simple Certificate Enrollment Protocol (SCEP)

SCEP is the standard for automatically provisioning and renewing certificates avoiding manual installation and re-installation of certificates on clients.

A Cisco IOS Registration Agent (RA) (e.g. Cisco IOS router) can serve as a proxy (e.g. SCEP RA) to the SCEP enabled CA that is to issue certificates.

Need to ensure that the same CA chain is used for issuing certificates to the phones as well as for the RADIUS servers; otherwise server validation could fail.

For initial certificate enrollment via SCEP, the Cisco Wireless IP Phone 8821 and 8821-EX needs to be connected to a network either while docked with a supported USB to Ethernet dongle connected in the back of the dock or using the default Wi-Fi settings (i.e. SSID = cisco and Security Mode = None), which has connectivity to the Cisco Unified Communications Manager.

Use of a supported USB to Ethernet dongle for initial provisioning purposes only and not to convert the Cisco Wireless IP Phone 8821 or 8821-EX to a wired IP phone.

The following USB to Ethernet dongles are supported.

- Apple USB 2.0 Ethernet Adapter (www.apple.com)
- Belkin B2B048 USB 3.0 Gigabit Ethernet Adapter (www.belkin.com)
- D-Link DUB-E100 USB 2.0 Fast Ethernet Adapter (www.dlink.com)
- Linksys USB3GIG USB 3.0 Gigabit Ethernet Adapter (www.linksys.com)
- Linksys USB300M USB 2.0 Ethernet Adapter (www.linksys.com)

The Cisco Wireless IP Phone 8821 and 8821-EX utilize the following parameters defined in Cisco Unified Communications Manager for SCEP requests.

The **WLAN SCEP Server** must be configured to include either the IP address or hostname of the SCEP RA.

The **WLAN Root CA Fingerprint (SHA256 or SHA1)** must be configured to include the fingerprint of the CA that issuing the certificates. If the issuing CA in which the SCEP RA is enrolled to is a subordinate CA, then enter its fingerprint and not the fingerprint of the root CA. The defined fingerprint is used to validate the received certificate.

Removing these parameters will disable SCEP.

WLAN SCEP Server	10.195.19.65	<input checked="" type="checkbox"/>
WLAN Root CA Fingerprint (SHA256 or SHA1)	81512B4316429092925C6891701B374EBD254447	<input checked="" type="checkbox"/>

The Cisco Wireless IP Phone 8821 and 8821-EX then sends a SCEP enroll request to the SCEP RA including the phone's Manufacturing Installed Certificate (MIC) as the Proof of Identity (POI).

The SCEP RA validates the phone's MIC using the certificate of the subordinate CA that issued the phone's MIC, then passes it to the RADIUS server for further device authentication.

The RADIUS server validates the device and sends a response to the SCEP RA.

The SCEP RA then forwards the enroll request to the CA if RADIUS authentication was successful.

The SCEP RA receives the user certificate from the CA and sends it to the phone after it receives a poll request from the phone.

The Cisco Wireless IP Phone 8821 and 8821-EX will periodically check the user and server certificate expiration periods.

Certificate renewal will occur when the expiration date is within 50 days.

If the CA certificate used to define the **WLAN Root CA Fingerprint (SHA256 or SHA1)** has expired, then the phone will send a SCEP getca request for a new CA certificate, but the admin would need to update the fingerprint in the phone's configuration within Cisco Unified Communication Manager to match the new CA certificate prior so it can be successfully validated. The old CA certificate will then be removed if the new one is successfully received from the CA.

If the user certificate has expired, the phone will send a new SCEP enroll request to update the user certificate. The old user certificate will then be removed if a new user certificate is successfully received from the CA.

Certificate Authority (CA) Configuration

It is recommended to use Microsoft® Certificate Authority (CA) servers.

Use the following guidelines to configure the Microsoft CA.

- Create Certificate Authority and Active Directory Domain Service on Microsoft Windows server.
- Enable Network Device Enrollment Service.
- Make **Administrator** a member of **IIS_IUSERS** group by going to **MemberOf** tab of user property screen.
- Launch **Server Manager**, then click **Add roles**.

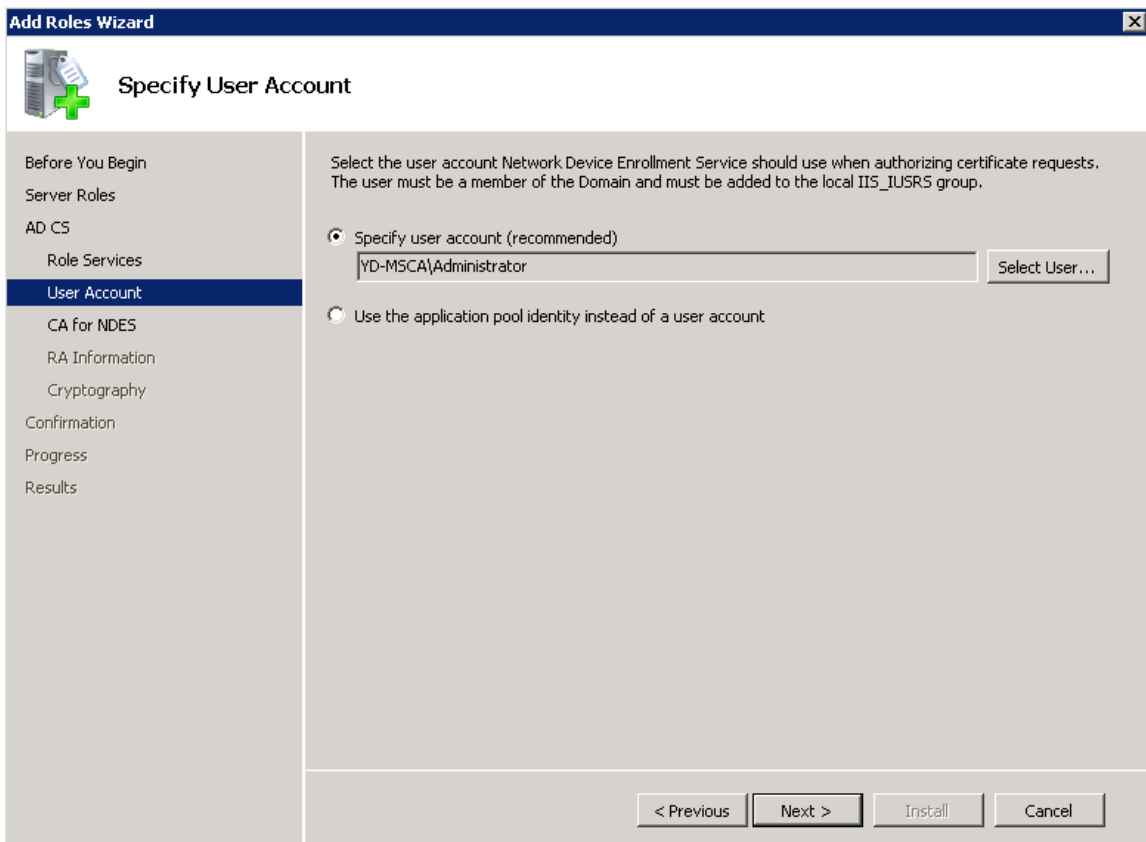

- On the **Select Server Role** page, select the **Active Directory Certificate Services** role, then click **Next**.
- Add the **Network Device Enrollment Service** role service.
- In the **Add Roles Wizard**, on the **Select Role Services** page, select the **Network Device Enrollment Service** check box, then click **Next**.

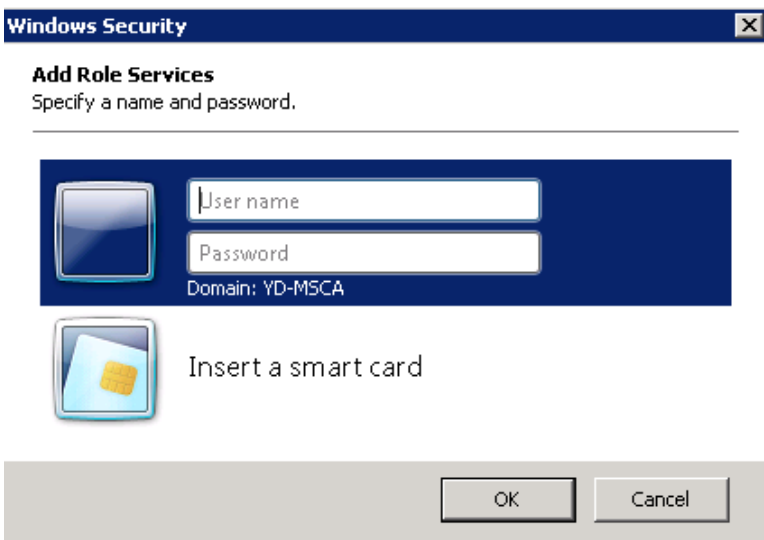

- The wizard will detect whether all the required dependencies are installed. If any dependencies are missing, you will be prompted with a dialog box explaining what is missing and requesting your permission to install the dependencies. Click **Yes** to continue the installation.

- Click **User Account** under **Role Services** and then click **Select User....**

- Type in **Administrator** as the user name, then enter the password.

- Enter the Registration Authority information.

< Previous Next > Install Cancel

- Select **Install**.

- A confirmation page will be displayed if the installation was successful.

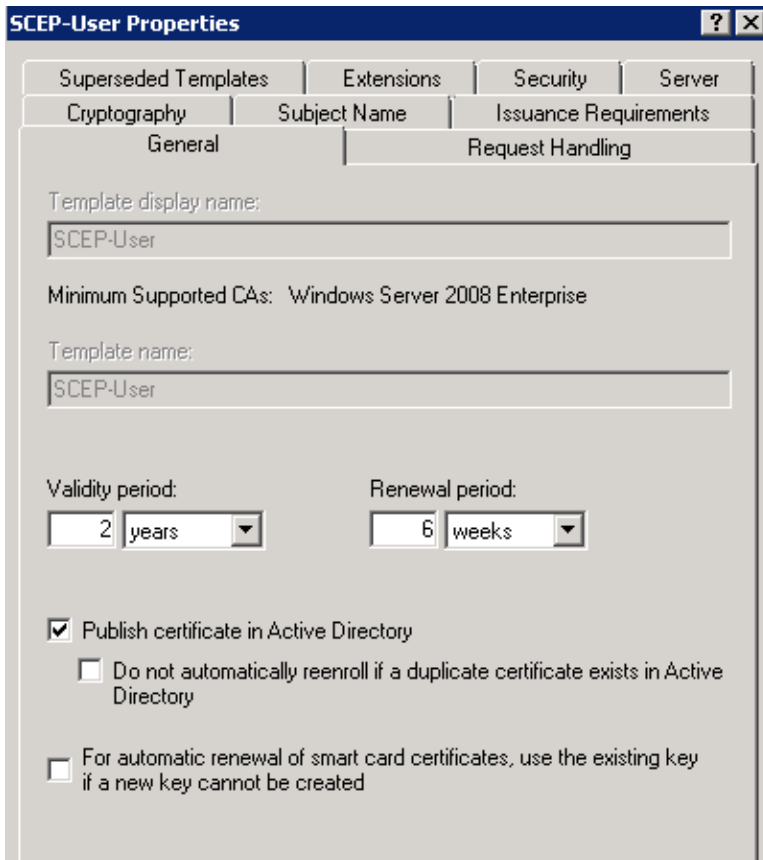

- Disable SCEP enrollment challenge password requirement via **regedit** by setting **EnforcePassword** to **0**.
(HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Cryptography > MSCEP > EnforcePassword)

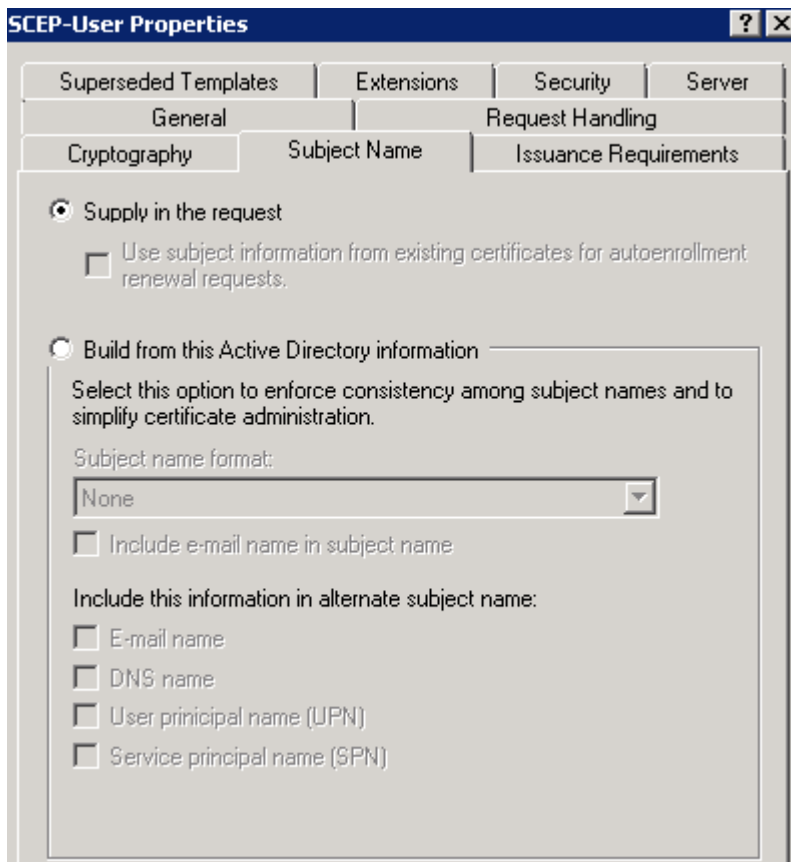

- SCEP uses the certificate template that is set in the registry for issuing certificates.
(HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Cryptography > MSCEP)

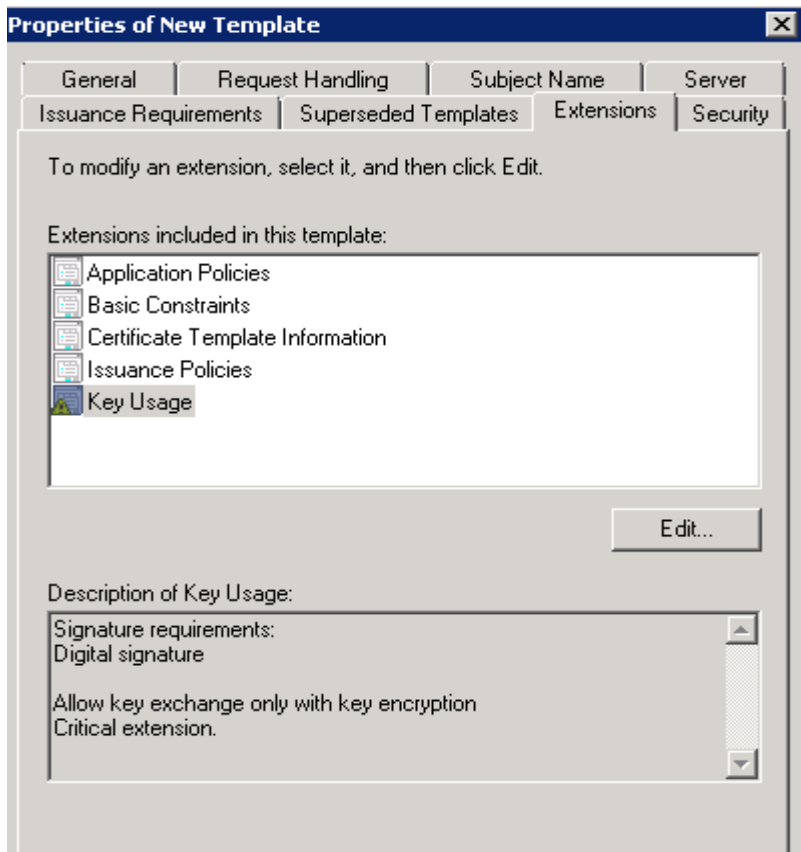

- Configure the **Validity Period** on the **General** tab as necessary.

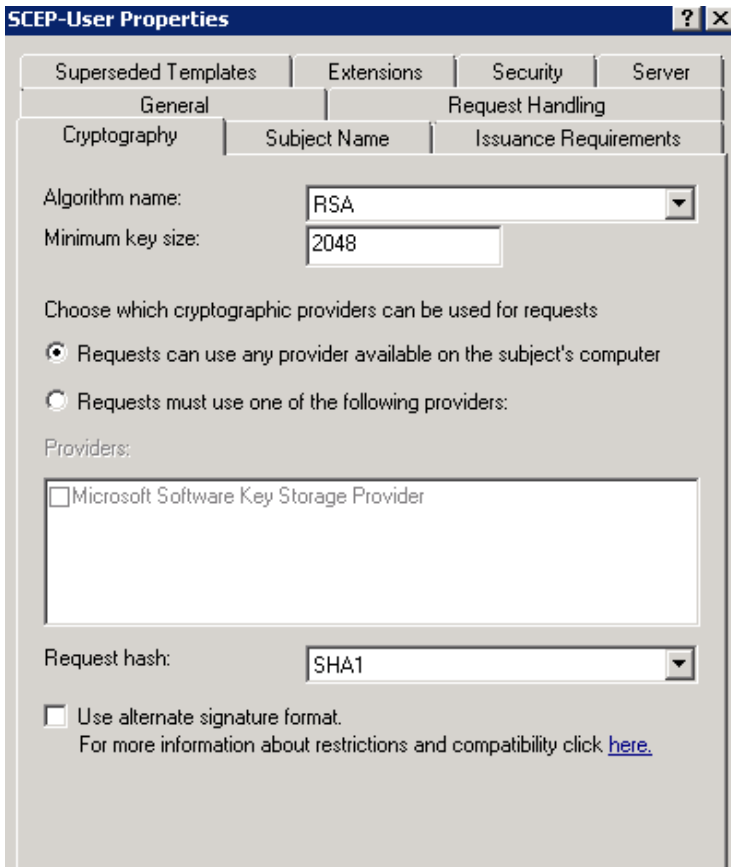

- Configure **Subject Name** tab as shown below.

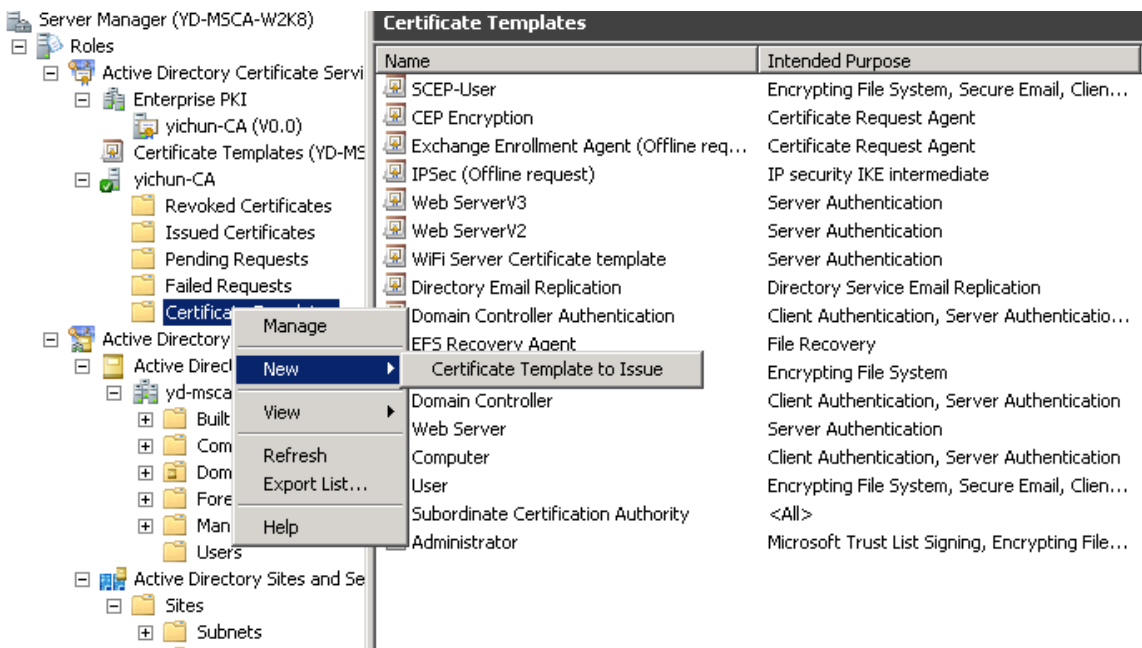

- Configure **Extensions** tab as shown below.

- Configure **Algorithm Name**, **Minimum Key Size**, and **Request Hash** as necessary on the **Cryptography** tab.

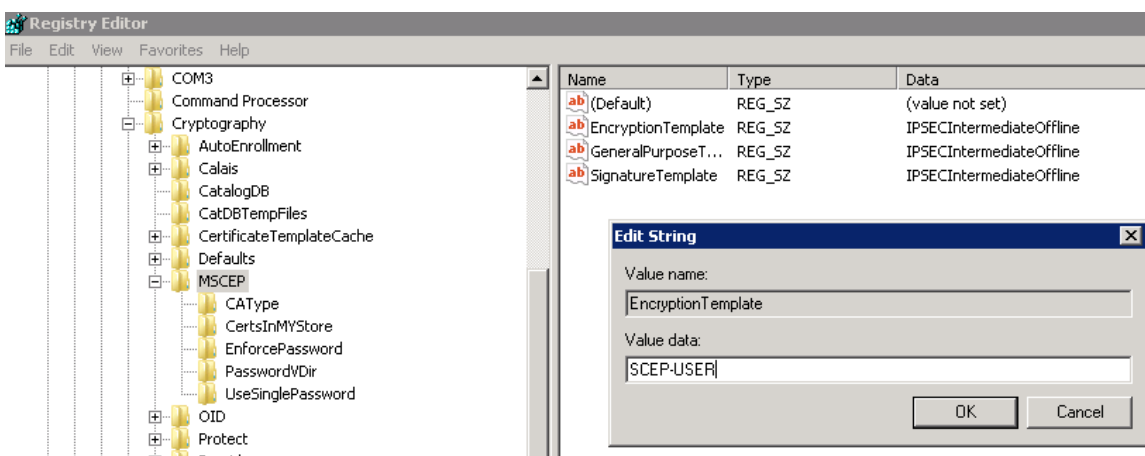

- Enable the newly created template by right clicking **Certificate Templates** then selecting **New > Certificate Template to Issue**.

- Select **SCEP User** template.

- Associate the newly created template to SCEP via **regedit**.

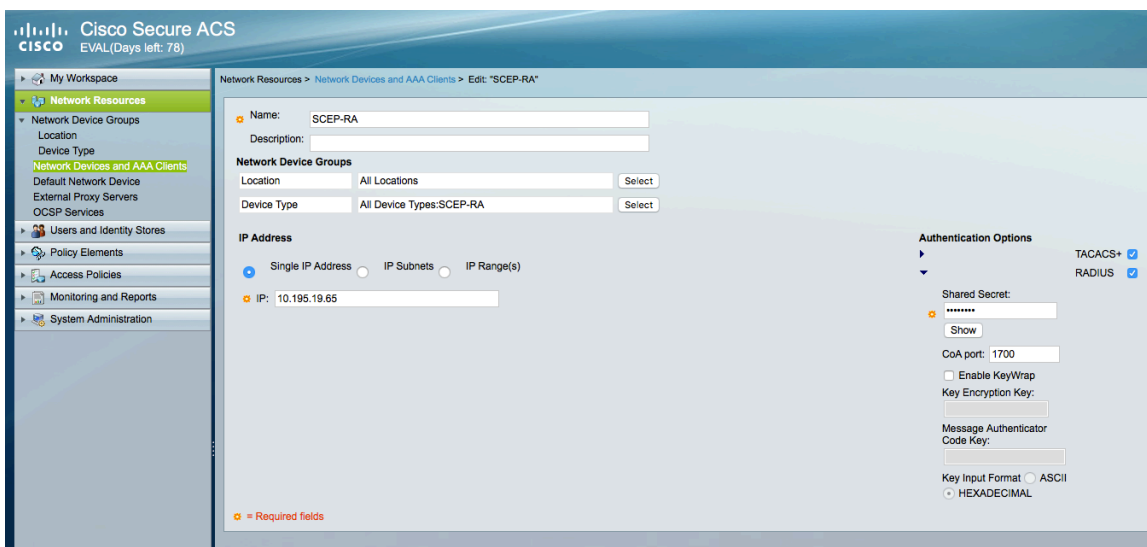

- Go to **IIS > Application Pools** to stop then start the SCEP service for the new template to take effect.

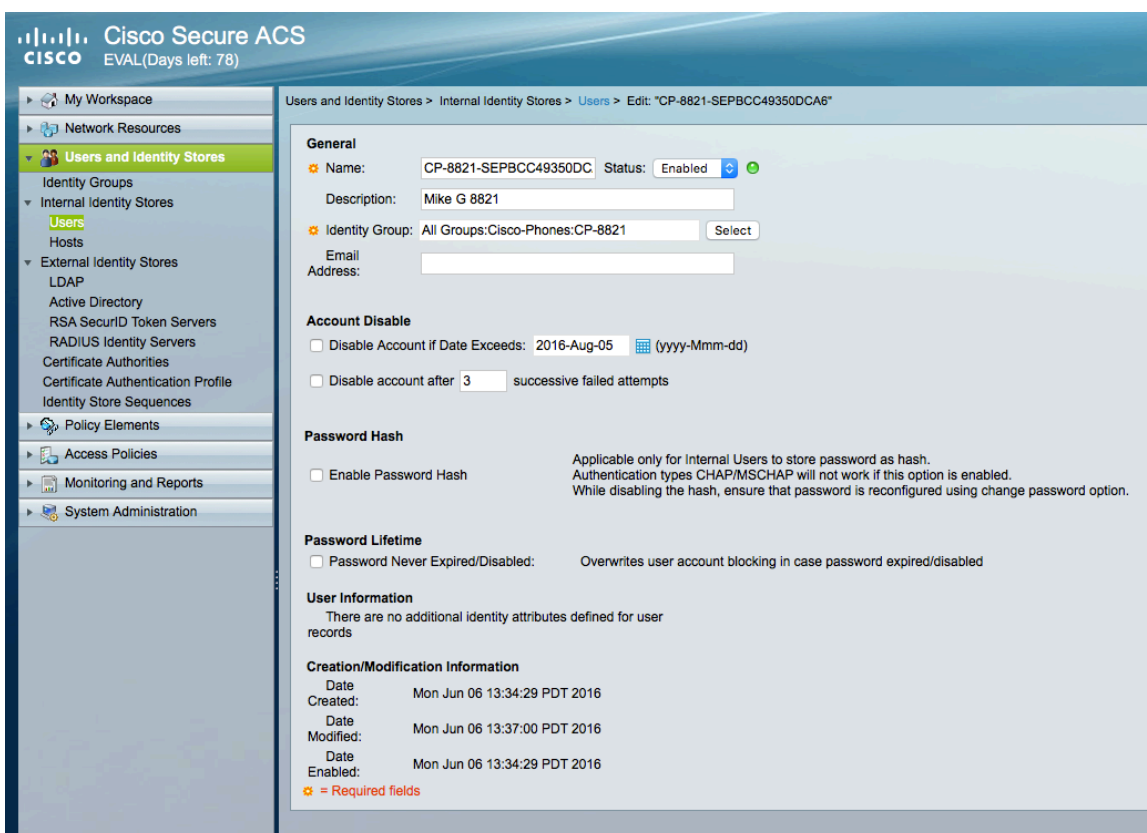

RADIUS Configuration

Use the following guidelines to configure the RADIUS server.

- Add the SCEP RA under **Network Device and AAA Clients**.
- Configure the RADIUS shared secret that the SCEP RA is currently configured for.

- Create a user account matching the common name of the phone's Manufacturing Installed Certificate (MIC) with the password set to **cisco** (e.g. CP-8821-SEPxxxxxxxxxxxx).

- Add the Cisco Manufacturing CA chain to the RADIUS trust list as well as any other CA chains utilized for authentication.

- Create a **Certificate Authentication Profile**.

- Create an **Identity Store Sequence** to be used for EAP-TLS authentication.
- Check **Certificate Based**, select the newly created **Certificate Authentication Profile**, and select **Internal Users** as the additional identity store.

- Create an **Identity Store Sequence** to be used for SCEP authentication.
- Check **Password Based**, select the newly created **Certificate Authentication Profile**, and select **Internal Users** as the identity store.

- Under **Identity**, rules can be defined to match various conditions then determine which identity source to use for authentication.

- Under **Identity**, rules can be defined to match various conditions then determine which authorization profile to use.

SCEP RA Configuration

Currently only a Cisco IOS router running IOS version 15.1(4)M10 or later is supported as the SCEP RA.

Use the following guidelines to configure a Cisco IOS router as a SCEP RA.

- Enable HTTP server on the Cisco IOS router.

```
ISR_RA# configure terminal
ISR_RA(config)# ip http server
ISR_RA(config)# exit
```

- Configure a RADIUS server for device authentication.

```
ISR_RA# configure terminal
ISR_RA(config)# radius server MyRadius
ISR_RA(config-radius-server)# address ipv4 10.195.19.63 auth-port 1812 acct-port 1813
ISR_RA(config-radius-server)# key <REMOVED>
ISR_RA(config-radius-server)# exit
ISR_RA(config)# aaa authorization network PhoneList group radius
ISR_RA(config)# exit
```

- Configure a PKI trustpoint for the MIC's CA chain to validate the phone's MIC.

```
ISR_RA# configure terminal
ISR_RA(config)# crypto pki trustpoint MIC_trustpoint
ISR_RA(ca-trustpoint)# authorization list PhoneList
ISR_RA(ca-trustpoint)# authorization username subjectname commonname
ISR_RA(ca-trustpoint)# exit
ISR_RA(config)# crypto pki trustpoint MIC_trustpoint
ISR_RA(ca-trustpoint)# enrollment terminal
ISR_RA(ca-trustpoint)# revocation-check none
ISR_RA(ca-trustpoint)# exit
ISR_RA(config)# crypto pki authenticate MIC_trustpoint
```

Enter the base 64 encoded Manufacturing CA certificate. End with a blank line or the word **quit** on a line by itself.

Certificate Removal

Certificates can be removed either via the admin webpage interface or via the local user interface.

To remove a certificate via the admin webpage, select **Delete** for the corresponding certificate, then restart the phone once a certificate has been removed.

Bluetooth Settings

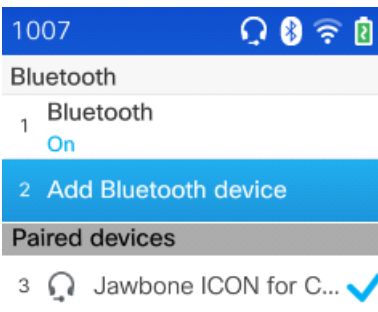

The Cisco Wireless IP Phone 8821 and 8821-EX include Bluetooth 3.0 support, which enables hands-free communications.

To pair a Bluetooth headset to the Cisco Wireless IP Phone 8821 and 8821-EX, follow the instructions below.

- Navigate to **Settings > Bluetooth**.
- Ensure that **Bluetooth** is set to **On**.
Ensure **Bluetooth** is enabled in the Cisco Unified Communications Manager.
- Select **Add Bluetooth device**.
Ensure the Bluetooth device is in pairing mode.

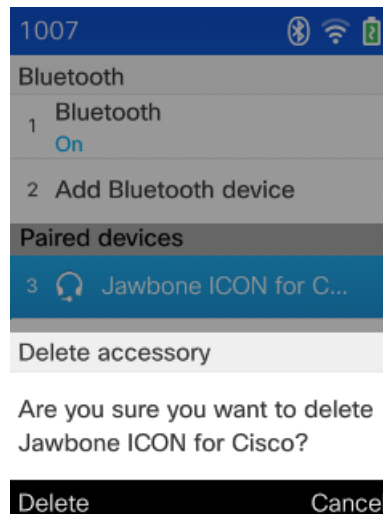

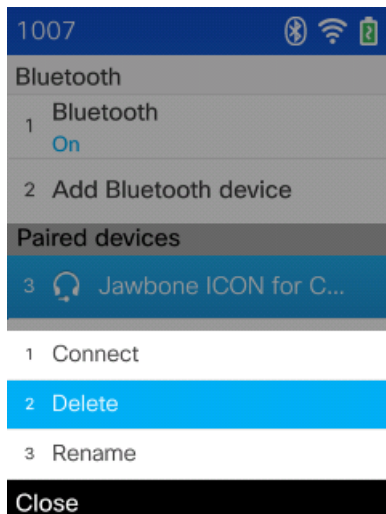

- Select the Bluetooth device after it is displayed in the list.
- The Cisco Wireless IP Phone 8821 and 8821-EX will then attempt to pair will attempt to use the pin code **0000**. If unsuccessful, enter the pin code when prompted.
- Once paired, then the Cisco Wireless IP Phone 8821 and 8821-EX will attempt to connect to the Bluetooth device.

- Selecting the Bluetooth device then selecting **Disconnect** will disconnect that currently connected Bluetooth device.

- Select **Delete** to unpair the selected Bluetooth device.

Upgrading Firmware

Cisco Unified Communications Manager

To upgrade the firmware, install the signed COP file for Cisco Unified Communications Manager.

For information on how to install the COP file, refer to the Cisco Unified Communications Manager Operating System Administration Guide at this URL:

<http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-maintenance-guides-list.html>

The downloaded phone configuration file is parsed and the device load is identified. The Cisco Wireless IP Phone 8821 or 8821-EX then downloads the firmware files to flash if it is not running the specified image already.

The Load Server can be specified as an alternate TFTP server to retrieve firmware files, which is located in the product specific configuration section of Cisco Wireless IP Phone 8821 and 8821-EX within Cisco Unified Communications Manager Administration.

Cisco Unified Communications Manager Express

To install the firmware on Cisco Unified Communications Manager Express, extract the contents of the TAR file and upload into the router's flash. Each file will need to be enabled for TFTP download. Configure the phone load and reset the phones to upgrade the firmware.

Example:

```
tftp-server flash:/8821/sip8821.11-0-3SR6-15.loads alias sip8821.11-0-3SR6-15.loads
tftp-server flash:/8821/dtblob8821.HE-01-005.sbn alias dtblob8821.HE-01-005.sbn
tftp-server flash:/8821/fbi8821.HE-01-010.sbn alias fbi8821.HE-01-010.sbn
tftp-server flash:/8821/kern8821.11-0-3SR6-15.sbn alias kern8821.11-0-3SR6-15.sbn
tftp-server flash:/8821/rootfs8821.11-0-3SR6-15.sbn alias rootfs8821.11-0-3SR6-15.sbn
tftp-server flash:/8821/sb28821.HE-01-020.sbn alias sb28821.HE-01-020.sbn
tftp-server flash:/8821/vc48821.11-0-3SR6-15.sbn alias vc48821.11-0-3SR6-15.sbn
!

```

IP Phone Services

The Cisco Wireless IP Phone 8821 and 8821-EX are capable of supporting Extensible Markup Language (XML) applications.

For information on IP phone services configuration, refer to the following URL.

http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/cucm/admin/8_6_1/ccmcfg/bccm-861-cm/b06phsrv.html

Extensible Markup Language (XML)

The following document provides the information needed for eXtensible Markup Language (XML) and X/Open System Interface (XSI) programmers and system administrators to develop and deploy IP phone services.

<http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-programming-reference-guides-list.html>

Troubleshooting

Phone Webpages

Cisco Wireless IP Phone 8821 and 8821-EX information can be gathered remotely by accessing the phone's standard or admin webpage interfaces.

The standard webpage interface (<https://x.x.x.x>) contains read-only information regarding device information, network setup, streaming statistics, device logs etc. To access the standard webpage interface, **Web Access** must be enabled in Cisco Unified Communications Manager

The admin webpage interface (<https://x.x.x.x:8443>) contains all of the info as the standard read-only page plus a few extra configurable pages (i.e. Certificates, Date and time, and Phone restart). To access the admin webpage interface, **Web Admin** must be enabled and **Admin Password** must be configured in Cisco Unified Communications Manager

Device Information

The Cisco Wireless IP Phone 8821 and 8821-EX provide device information, where network status, MAC address and version information is displayed.

Browse to the standard web interface (<https://x.x.x.x>) of the Cisco Wireless IP Phone 8821 or 8821-EX select **Device information** to view this information.

WLAN Signal Indicator

The WLAN signal indicator is displayed in the upper right hand corner of the main screen when the Cisco Wireless IP Phone 8821 and 8821-EX is connected to an access point.

Neighbor List

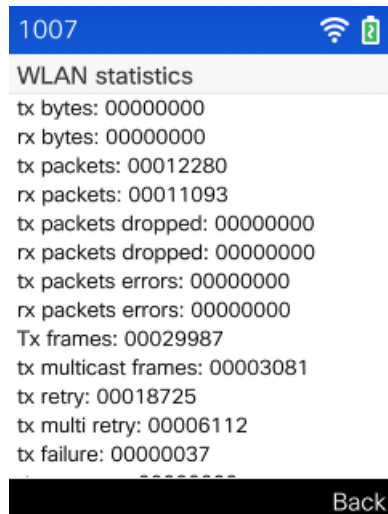

Current access point and neighbor access point details can be viewed by selecting **Settings > Admin settings > Neighbor list**.
 Cisco Wireless IP Phone 8821 and 8821-EX Wireless LAN Deployment Guide

AP name, BSSID, SSID, Channel, RSSI, and CU (Channel Utilization) information will be displayed.

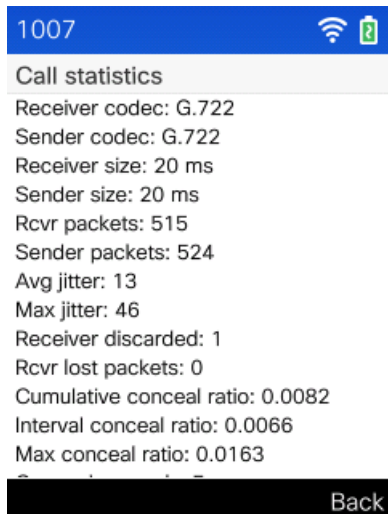

WLAN Statistics

Wireless statistic information can be viewed locally on the phone under **Applications > Admin settings > Status > Wireless statistics**.

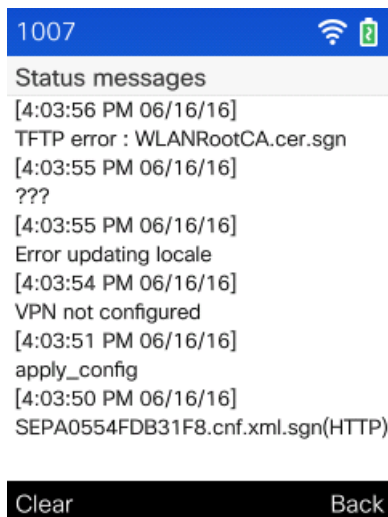

Call Statistics

Call statistic information can be viewed locally on the phone under **Applications > Admin settings > Status > Call statistics**.

Status Messages

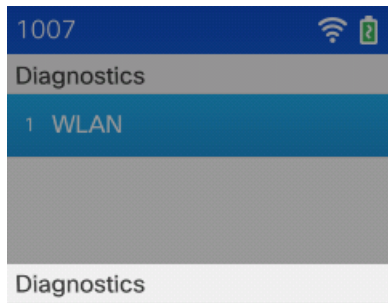

Status messages can be viewed locally on the phone under **Applications > Admin settings > Status > Status messages**.

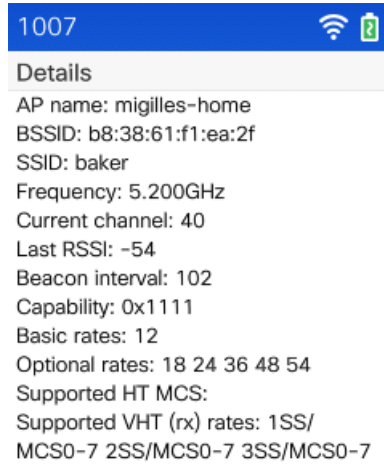

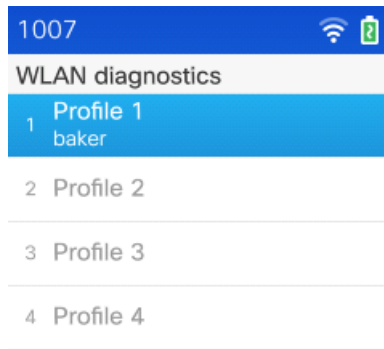

Diagnostics

WLAN Diagnostics is an online tool that can display details for each access point that matches a configured Wi-Fi Profile when selecting **Settings > Admin settings > Diagnostics > WLAN**.

AP name, BSSID, SSID, Frequency, Current channel, Last RSSI, Beacon Interval, Data rate, DTIM, Country code, Channel, Power constraint, Power limit, CU, Station count, Admission capacity, WMM, UAPSD, Proxy ARP, CCX, and Access category information will be displayed.

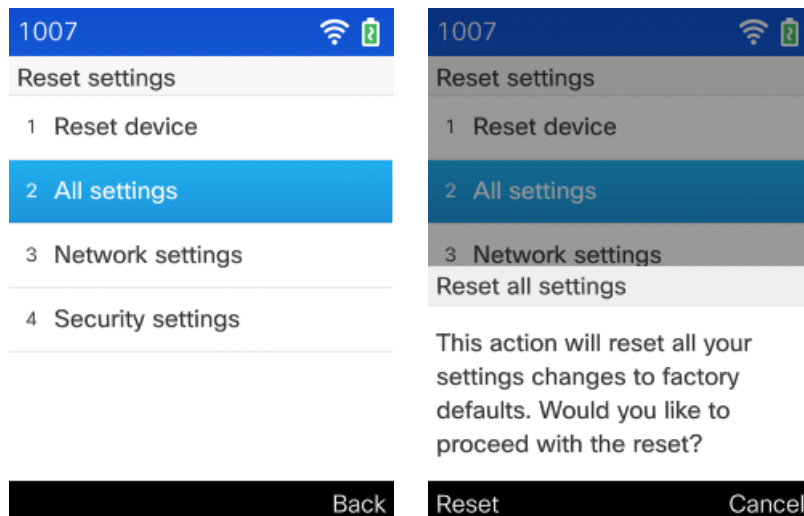

Voice call quality may be degraded when using WLAN diagnostics. Would you like to proceed?

Restoring Factory Defaults

The configuration of the Cisco Wireless IP Phone 8821 and 8821-EX can be reset to factory defaults by selecting **Applications > Admin settings > Reset settings > All settings**.

A confirmation screen will appear where **Reset** must be selected to proceed with the factory data reset.

If the Cisco Wireless IP Phone 8821 or 8821-EX is not able to boot properly, a factory reset can also be initiated via the following procedure:

- Turn the phone off by pressing the red button.
- Press and hold the # key, then power on the phone via the red button.
- Keep the red button and # key held down until the LED changes to amber.
- Once the LED changes to amber, release the red button and # key.
- Then press **1 2 3 4 5 6 7 8 9 * 0 #**.
- The LED will blink green to indicate the factory reset sequence has been accepted; otherwise will blink red to indicate factory reset has not been accepted.
- The Cisco Wireless IP Phone 8821 or 8821-EX will then continue the normal boot process and have the factory settings restored.

To boot the alternate image, perform the following procedure.

- Turn the phone off by pressing the red button.
- Press and hold the * key, then power on the phone via the red button.
- Keep the red button and * key held down until the LED changes to red.
- Once the LED changes to red, release the red button and * key.
- The Cisco Wireless IP Phone 8821 or 8821-EX will then boot using the alternate image for that one time only.

Capturing a Screenshot of the Phone Display

The current display of the Cisco Wireless IP Phone 8821 or 8821-EX can be captured by browsing to <http://x.x.x.x/CGI/Screenshot>, where x.x.x.x is the IP address of the Cisco Wireless IP Phone 8821 or 8821-EX. At the prompt enter the username and password for the account that the Cisco Wireless IP Phone 8821 or 8821-EX is associated to in Cisco Unified Communications Manager.
