Role-Based CLI Access

The Role-Based CLI Access feature allows the network administrator to define “views,” which are a set of operational commands and configuration capabilities that provide selective or partial access to Cisco IOS EXEC and configuration (Config) mode commands. Views restrict user access to Cisco IOS command-line interface (CLI) and configuration information; that is, a view can define what commands are accepted and what configuration information is visible. Thus, network administrators can exercise better control over access to Cisco networking devices.

Feature History for Role-Based CLI Access

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3(7)T</td>
<td>This feature was introduced.</td>
</tr>
<tr>
<td>12.3(11)T</td>
<td>The CLI view capability was extended to restrict user access on a per-interface level, and additional CLI views were introduced to support the extended view capability. Also, support to group configured CLI views into a superview was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRB</td>
<td>This feature was integrated into Cisco IOS Release 12.2(33)SRB.</td>
</tr>
</tbody>
</table>

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Contents

- Information About Role-Based CLI Access, page 2
- How to Use Role-Based CLI Access, page 3
- Configuration Examples for Role-Based CLI Access, page 9
Prerequisites for Role-Based CLI Access

Your image must support CLI views.

Restrictions for Role-Based CLI Access

Lawful Intercept Images Limitation
Because CLI views are a part of the Cisco IOS parser, CLI views are a part of all platforms and Cisco IOS images. However, the lawful intercept view is available only in images that contain the lawful intercept subsystem.

Maximum Number of Allowed Views
The maximum number of CLI views and superviews, including one lawful intercept view, that can be configured is 15. (This does not include the root view.)

Information About Role-Based CLI Access

To create and use views, you should understand the following concepts:

- Benefits of Using CLI Views, page 2
- Root View, page 2
- View Authentication via a New AAA Attribute, page 3

Benefits of Using CLI Views

Views: Detailed Access Control
Although users can control CLI access via both privilege levels and enable mode passwords, these functions do not provide network administrators with the necessary level of detail needed when working with Cisco IOS routers and switches. CLI views provide a more detailed access control capability for network administrators, thereby, improving the overall security and accountability of Cisco IOS software.

As of Cisco IOS Release 12.3(11)T, network administrators can also specify an interface or a group of interfaces to a view; thereby, allowing access on the basis of specified interfaces.

Root View

When a system is in “root view,” it has all of the access privileges as a user who has level 15 privileges. If the administrator wishes to configure any view to the system (such as a CLI view, a superview, or a lawful intercept view), the system must be in root view.
The difference between a user who has level 15 privileges and a root view user is that a root view user can configure a new view and add or remove commands from the view. Also, when you are in a CLI view, you have access only to the commands that have been added to that view by the root view user.

**View Authentication via a New AAA Attribute**

View authentication is performed by an external authentication, authorization, and accounting (AAA) server via the new attribute “cli-view-name.”

AAA authentication associates only one view name to a particular user; that is, only one view name can be configured for a user in an authentication server.

**How to Use Role-Based CLI Access**

This section contains the following procedures:
- Configuring a CLI View, page 3 (required)
- Configuring a Lawful Intercept View, page 5 (optional)
- Configuring a Superview, page 7 (optional)
- Monitoring Views and View Users, page 9 (optional)

**Configuring a CLI View**

Use this task to create a CLI view and add commands or interfaces to the view, as appropriate.

**Prerequisites**

Before you create a view, you must perform the following tasks:
- Enable AAA via the `aaa new-model` command. (For more information on enabling AAA, see the chapter “Configuring Authentication” in the *Cisco IOS Security Configuration Guide*, Release 12.3.
- Ensure that your system is in root view—not privilege level 15.

**SUMMARY STEPS**

1. `enable view`
2. `configure terminal`
3. `parser view view-name`
4. `secret 5 encrypted-password`
5. `commands parser-mode {include | include-exclusive | exclude} {all} [interface interface-name | command]`
6. `exit`
7. `exit`
8. `enable [privilege-level] [view view-name]`
9. `show parser view [all]`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable view</td>
<td>Enables root view.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable view</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> parser view view-name</td>
<td>Creates a view and enters view configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# parser view first</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> secret 5 encrypted-password</td>
<td>Associates a command-line interface (CLI) view or supervisor with a password.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-view)# secret 5 secret</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> commands parser-mode {include</td>
<td>include-exclusive</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-view)# commands exec include show version</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits view configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-view)# exit</td>
<td></td>
</tr>
</tbody>
</table>
Troubleshooting Tips

After you have successfully created a view, a system message such as the following will be displayed:
%PARSER-6-VIEW_CREATED: view 'first' successfully created.

After you have successfully deleted a view, a system message such as the following will be displayed:
%PARSER-6-VIEW_DELETED: view 'first' successfully deleted.

You must associate a password with a view. If you do not associate a password, and you attempt to add commands to the view via the commands command, a system message such as the following will be displayed:
%Password not set for view <viewname>.

Configuring a Lawful Intercept View

Use this task to initialize and configure a view for lawful-intercept-specific commands and configuration information. (Only an administrator or a user who has level 15 privileges can initialize a lawful intercept view.)

About Lawful Intercept Views

Like a CLI view, a lawful intercept view restricts access to specified commands and configuration information. Specifically, a lawful intercept view allows a user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of simple network management protocol (SNMP) commands that store information about calls and users.
Commands available in lawful intercept view belong to one of the following categories:

- Lawful intercept commands that should not be made available to any other view or privilege level
- CLI views that are useful for lawful intercept users but do not have to be excluded from other views or privilege levels

Prerequisites

Before you initialize a lawful intercept view, ensure that the privilege level is set to 15 via the `privilege` command.

SUMMARY STEPS

1. `enable view`
2. `configure terminal`
3. `li-view li-password user username password password`
4. `username [lawful-intercept] name [privilege privilege-level | view view-name] password password`
5. `parser view view-name`
6. `secret 5 encrypted-password`
7. `name new-name`

DETAILED STEPS

<table>
<thead>
<tr>

</tbody>
</table>
Role-Based CLI Access

How to Use Role-Based CLI Access

Cisco IOS Releases 12.3(7)T, 12.3(11)T, and 12.2(33)SRB

Troubleshooting Tips

To display information for all users who have access to a lawful intercept view, issue the `show users lawful-intercept` command. (This command is available only to authorized lawful intercept view users.)

Configuring a Superview

Use this task to create a superview and add at least one CLI view to the superview.

About Superviews

A superview consists of one or more CLI views, which allow users to define what commands are accepted and what configuration information is visible. Superviews allow a network administrator to easily assign all users within configured CLI views to a superview instead of having to assign multiple CLI views to a group of users.

Superviews contain the following characteristics:

- A CLI view can be shared among multiple superviews.
- Commands cannot be configured for a superview; that is, you must add commands to the CLI view and add that CLI view to the superview.
- Users who are logged into a superview can access all of the commands that are configured for any of the CLI views that are part of the superview.
- Each superview has a password that is used to switch between superviews or from a CLI view to a superview.
- If a superview is deleted, all CLI views associated with that superview will not be deleted too.

Adding CLI Views to a Superview

You can add a view to a superview only after a password has been configured for the superview (via the `secret 5` command). Thereafter, issue the `view` command in view configuration mode to add at least one CLI view to the superview.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td><code>parser view view-name</code></td>
<td>(Optional) Enters view configuration mode, which allows you to change the lawful intercept view password or the lawful intercept view name.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config)# parser view li view name</code></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><code>secret 5 encrypted-password</code></td>
<td>(Optional) Changes an existing password for a lawful intercept view.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-view)# secret 5 secret</code></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td><code>name new-name</code></td>
<td>(Optional) Changes the name of a lawful intercept view. If this command is not issued, the default name of the lawful intercept view is “li-view.”</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-view)# name second</code></td>
<td></td>
</tr>
</tbody>
</table>
Before adding a CLI view to a superview, ensure that the CLI views that are added to the superview are valid views in the system; that is, the views have been successfully created via the `parser view` command.

**SUMMARY STEPS**

1. `enable view`
2. `configure terminal`
3. `parser view superview-name superview`
4. `secret 5 encrypted-password`
5. `view view-name`
6. `exit`
7. `exit`
8. `show parser view [all]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable view</code></td>
<td>Enables root view.</td>
</tr>
<tr>

</tbody>
</table>
Role-Based CLI Access

Configuration Examples for Role-Based CLI Access

Cisco IOS Releases 12.3(7)T, 12.3(11)T, and 12.2(33)SRB

Monitoring Views and View Users

To display debug messages for all views—root, CLI, lawful intercept, and super, use the `debug parser view` command in privileged EXEC mode.

Configuration Examples for Role-Based CLI Access

This section contains the following configuration examples:

- Configuring a CLI View: Example, page 9
- Verifying a CLI View: Example, page 10
- Configuring a Lawful Intercept View: Example, page 11
- Configuring a Superview: Example, page 12

Configuring a CLI View: Example

The following example shows how to configure two CLI views, “first” and “second.” Thereafter, you can verify the CLI view in the running configuration.

```
Router(config)# parser view first
00:11:40:%PARSER-6-VIEW_CREATED:view 'first' successfully created.
Router(config-view)# secret 5 firstpass
Router(config-view)# command exec include show version
Router(config-view)# command exec include configure terminal
Router(config-view)# command exec include all show ip
Router(config-view)# exit
```

```
Router(config)# parser view second
00:13:42:%PARSER-6-VIEW_CREATED:view 'second' successfully created.
Router(config-view)# secret 5 secondpass
Router(config-view)# command exec include-exclusive show ip interface
Router(config-view)# command exec include logout
Router(config-view)# exit
```

Step 7

<table>
<thead>
<tr>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exit</code></td>
</tr>
</tbody>
</table>

**Example:**

```
Router(config)# exit
```

*Purpose*

Exits global configuration mode.

Step 8

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show parser view [all]</code></td>
<td>(Optional) Displays information about the view that the user is currently in.</td>
</tr>
<tr>
<td></td>
<td>• <strong>all</strong>—Displays information for all views that are configured on the router.</td>
</tr>
</tbody>
</table>

**Note** Although this command is available for both root and lawful intercept users, the **all** keyword is available only to root users. However, the **all** keyword can be configured by a user in root view to be available for users in lawful intercept view and CLI view.

```
Example:
Router# show parser view
```

Command or Action | Purpose
--- | ---
exit | Exits global configuration mode.
```
Role-Based CLI Access

Configuration Examples for Role-Based CLI Access

Cisco IOS Releases 12.3(7)T, 12.3(11)T, and 12.2(33)SRB

!  
Router(config-view)# do show run | beg view  
parser view first  
secret 5 $1$MCmh$QuZaU8PIMP1ff9sFCZvgW/  
commands exec include configure terminal  
commands exec include configure  
commands exec include all show ip  
commands exec include show version  
commands exec include show  
!
parser view second  
secret 5 $1$iP2M$R16BXKecMEiQexxLyqygW.  
commands exec include-exclusive show ip interface  
commands exec include show ip  
commands exec include show  
commands exec include logout  
!

Verifying a CLI View: Example

After you have configured the CLI views “first” and “second,” you can issue the enable view command to verify which commands are available in each view. The following example shows which commands are available inside the CLI view “first” after the user has logged into this view. (Because the show ip command is configured with the all option, a complete set of suboptions is shown, except the show ip interface command, which is using the include-exclusive keyword in the second view.)

Router# enable view first
Password:

00:28:23:%PARSER-6-VIEW_SWITCH:successfully set to view 'first'.
Router# ?
Exec commands:  
configure Enter configuration mode  
enable Turn on privileged commands  
exit Exit from the EXEC  
show Show running system information  

Router# show ?

flow NetFlow switching
Configuring a Lawful Intercept View: Example

The following example shows how to configure a lawful intercept view, add users to the view, and verify the users that were added:

! Initialize the LI-View.
Router(config-view)# li-view lipass user li_admin password li_adminpass
00:19:25:%PARSER-6-LI_VIEW_INIT:LI-View initialized.
Router(config-view)# end

! Enter the LI-View; that is, check to see what commands are available within the view.
Router# enable view li-view
Password:

00:22:57:%PARSER-6-VIEW_SWITCH:successfully set to view 'li-view'.
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# parser view li-view
Router(config-view)# ?
View commands:
  commands Configure commands for a view
  default Set a command to its defaults
  exit Exit from view configuration mode
  name New LI-View name ===This option only resides in LI View.
  no Negate a command or set its defaults
  password Set a password associated with CLI views

! NOTE: LI View configurations are never shown as part of ‘running-configuration’.

! Configure LI Users.
Router(config)# username lawful-intercept li-user1 password li-user1pass
Router(config)# username lawful-intercept li-user2 password li-user2pass

! Displaying LI User information.
Router# show users lawful-intercept

li_admin
li-user1
li-user2
Router#
Configuring a Superview: Example

The following sample output from the show running-config command shows that “view_one” and “view_two” have been added to superview “su_view1,” and “view_three” and “view_four” have been added to superview “su_view2”:

```
parser view su_view1 superview
   secret 5 <encoded password>
   view view_one
   view view_two

parser view su_view2 superview
   secret 5 <encoded password>
   view view_three
   view view_four
```

Command Reference

This section documents only new and modified commands.

**New Commands in Cisco IOS Release 12.3(7)T and 12.2(33)SRB**
- commands (view)
- li-view
- name (view)
- parser view
- show parser view

**New Commands in Cisco IOS Release 12.3(11)T and 12.2(33)SRB**
- parser view superview
- view

**New Command in Cisco IOS Release 12.3(14)T**
- secret

**Modified Commands in Cisco IOS Release 12.3(7)T and 12.2(33)SRB**
- enable
- show users
- username

**Modified Commands in Cisco IOS Release 12.3(11)T and 12.2(33)SRB**
- commands (view)
commands (view)

To add commands or an interface to a command-line interface (CLI) view, use the commands command in view configuration mode. To delete a command or an interface from a CLI view, use the no form of this command.

Syntax for Adding and Deleting Commands to a View

```
commands parser-mode {include | include-exclusive | exclude} [all] [command]
```

```
no commands parser-mode {include | include-exclusive | exclude} [all] [command]
```

Syntax for Adding and Deleting Interfaces to a View

```
commands parser-mode {include | include-exclusive} [all] [interface interface-name] [command]
```

```
no commands parser-mode {include | include-exclusive} [all] [interface interface-name] [command]
```

Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parser-mode</td>
<td>Mode in which the specified command exists. See Table 1 in the “Usage Guidelines” section for a list of available options for this argument.</td>
</tr>
<tr>
<td>include</td>
<td>Adds a specified command or a specified interface to the view and allows the same command or interface to be added to an additional view.</td>
</tr>
<tr>
<td>include-exclusive</td>
<td>Adds a specified command or a specified interface to the view and excludes the same command or interface from being added to all other views.</td>
</tr>
<tr>
<td>exclude</td>
<td>Denies access to commands in the specified parser mode.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) A “wildcard” that allows every command in a specified configuration mode that begins with the same keyword or every subinterface within a specified interface to be part of the view.</td>
</tr>
<tr>
<td>interface interface-name</td>
<td>(Optional) Interface that is added to the view.</td>
</tr>
<tr>
<td>command</td>
<td>(Optional) Command that is added to the view.</td>
</tr>
</tbody>
</table>

Note: This keyword is available only for command-based views.

Defaults

If this command is not enabled, a view will not have adequate information to deny or allow access to users.

Usage Guidelines

If a network administrator does not enter a specific command (via the `command` argument) or interface (via the `interface interface-name` option), users are granted access (via the `include` or `include-exclusive` keywords) or denied access (via the `exclude` keyword) to all commands within the specified parser-mode.

**parser-mode Options**

Table 1 shows some of the keyword options for the `parser-mode` argument in the `commands` command. The available mode keywords vary depending on your hardware and software version. To see a list of available mode options on your system, use the `commands ?` command.

**Examples**

The following example shows how to add the privileged EXEC command `show version` to both CLI views “first” and “second.” Because the `include` keyword was issued, the `show version` command can be added to both views.

```
Router(config)# parser view first
Router(config-view)# secret 5 secret
```
Router(config-view)# commands exec include show version
!
Router(config)# parser view second
Router(config-view)# secret 5 myview
Router(config-view)# commands exec include show version

The following example shows how to allow users in the view “first” to execute all commands that start with the word “show” except the show interfaces command, which is excluded by the view “second”:

Router(config)# parser view first
Router(config-view)# secret 5 secret
Router(config-view)# commands exec include all show
!
Router(config)# parser view second
Router(config-view)# secret 5 myview
Router(config-view)# commands exec include-exclusive show interfaces

</tr>
</tbody>
</table>

**Usage Guidelines**

Entering privileged EXEC mode enables the use of privileged commands. Because many of the privileged commands set operating parameters, privileged access should be password-protected to prevent unauthorized use. If the system administrator has set a password with the **enable password** global configuration command, you are prompted to enter the password before being allowed access to privileged EXEC mode. The password is case sensitive.

If an **enable** password has not been set, only enable mode can be accessed through the console connection.

Security levels can be set by an administrator using the **enable password** and **privilege level** commands. Up to 16 privilege levels can be specified, using the numbers 0 through 15. Using these privilege levels, the administrator can allow or deny access to specific commands. Privilege level 0 is associated with user EXEC mode, and privilege level 15 is associated with privileged EXEC mode.

For more information on defined privilege levels, see the *Cisco IOS Security Configuration Guide* and the *Cisco IOS Security Command Reference* publications.
If a level is not specified when entering the `enable` command, the user will enter the default mode of privileged EXEC (level 15).

**Accessing a CLI View**

CLI views restrict user access to specified CLI and configuration information. To configure and access CLI views, users must first enter into root view, which is accomplished via the `enable` command (without the `view-name` argument). Thereafter, users are prompted for a password, which is the same password as the privilege level 15 password.

The `view-name` argument is used to switch from one view to another view.

To prevent dictionary attacks, a user is prompted for a password even if an incorrect view name is given. The user is denied access only after an incorrect view name and password are given.

**Examples**

In the following example, the user enters privileged EXEC mode using the `enable` command. The system prompts the user for a password before allowing access to the privileged EXEC mode. The password is not printed to the screen. The user then exits back to user EXEC mode using the `disable` command. Note that the prompt for user EXEC mode is the greater than symbol (>). And the prompt for privileged EXEC mode is the number sign (#).

```
Router> enable
Password: <letmein>
Router# disable
Router>
```

This following example shows which commands are available inside the CLI view “first” after the user has logged into this view:

```
Router# enable view first
Password:
00:28:23:%PARSER-6-VIEW_SWITCH:successfully set to view 'first'.
Router# ?
Exec commands:
   configure Enter configuration mode
   enable   Turn on privileged commands
   exit     Exit from the EXEC

</thead>
<tbody>
<tr>
<td>12.3(7)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRB</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRB.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Like a command-line interface (CLI) view, a lawful intercept view restricts access to specified commands and configuration information. Specifically, a lawful intercept view allows a user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of simple network management protocol (SNMP) commands that stores information about calls and users.

Commands available in lawful intercept view belong to one of the following categories:

- Lawful intercept commands that should not be made available to any other view or privilege level.
- CLI that are useful for lawful intercept users but do not need to be excluded from other views or privilege levels.

**Note**

Only a system administrator or a level 15 privilege user can initialize a lawful intercept view.

**Examples**

The following example shows how to configure a lawful intercept view, add users to the view, and verify the users that were added to the view:

```
!Initialize the LI-View.
Router(config-view)# li-view li-pass user li_admin password li_adminpass
00:19:25:%PARSER-6-LI_VIEW_INIT:LI-View initialized.
Router(config-view)# end
```
Enter the LI-View; that is, check to see what commands are available within the view.

Router# enable view li-view
Password:

00:22:57:%PARSER-6-VIEW_SWITCH:successfully set to view 'li-view'.

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# parser view li-view
Router(config-view)#?

View commands:
commands Configure commands for a view
default Set a command to its defaults
exit Exit from view configuration mode
name New LI-View name ===This option only resides in LI View.
no Negate a command or set its defaults
password Set a password associated with CLI views

Router(config-view)#

! NOTE:LI View configurations are never shown as part of ‘running-configuration’.

! Configure LI Users.

Router(config)# username lawful-intercept li-user1 password li-user1pass
Router(config)# username lawful-intercept li-user2 password li-user2pass

! Displaying LI User information.

Router# show users lawful-intercept

li_admin
li-user1
li-user2
Router#

name (view)

To change the name of a lawful intercept view, use the name command in view configuration mode. To return to the default lawful intercept view name, which is “li-view,” use the no form of this command.

    name new-name
    no name new-name

Syntax Description

new-name  Lawful intercept view name.

Defaults

A lawful intercept view is called “li-view.”

Command Modes

View configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3(7)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRB</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRB.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Only a system administrator or a level 15 privilege user can change the name of a lawful intercept view.

Examples

The following example shows how to configure a lawful intercept view and change the view name to “myliview”:

    !Initialize the LI-View.
    Router(config-view)# li-view lipass user li_admin password li_adminpass
    00:19:25:%PARSER-6-LI_VIEW_INIT:LI-View initialized.
    Router(config-view)# name myliview
    Router(config-view)# end

parser view

To create or change a command-line interface (CLI) view and enter view configuration mode, use the `parser view` command in global configuration mode. To delete a view, use the `no` form of this command.

```
parser view view-name
no parser view view-name
```

**Syntax Description**

`view-name` View name, which can include 1 to 30 alphanumeric characters. The `view-name` argument must not have a number as the first character; otherwise, you will receive the following error message: “Invalid view name.”

**Defaults**

A CLI view does not exist.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3(7)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRB</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRB.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A CLI view is a set of operational commands and configuration capabilities that restrict user access to the CLI and configuration information; that is, a view allows users to define what commands are accepted and what configuration information is visible.

After you have issued the `parser view` command, you can configure the view via the `secret 5` command and the `commands` command.

To use the `parser view` command, the system of the user must be set to root view. The root view can be enabled via the `enable view` command.

**Examples**

The following example show how to configure two CLI views, “first” and “second.”

```
Router(config)# parser view first
00:11:40:%PARSER-6-VIEW_CREATED:view 'first' successfully created.
Router(config-view)# secret 5 firstpass
Router(config-view)# command exec include show version
Router(config-view)# command exec include configure terminal
Router(config-view)# command exec include all show ip
Router(config-view)# exit
Router(config)# parser view second
00:13:42:%PARSER-6-VIEW_CREATED:view 'second' successfully created.
Router(config-view)# secret 5 secondpass
Router(config-view)# command exec include-exclusive show ip interface
```
Router(config-view)# command exec include logout
Router(config-view)# exit

After you have successfully created a view, a system message such as the following will be displayed:
%PARSER-6-VIEW_CREATED: view 'first' successfully created.

After you have successfully deleted a view, a system message such as the following will be displayed:
%PARSER-6-VIEW_DELETED: view 'first' successfully deleted.

<td>Adds commands to a CLI view.</td>
</tr>
<tr>
<td></td>
<td>secret 5</td>
<td>Associates a CLI view or a superview with a password.</td>
</tr>
</tbody>
</table>
parser view superview

To create a superview and enter view configuration mode, use the `parser view superview` command in global configuration mode. To delete a superview, use the `no` form of this command.

```
parser view superview-name superview

no parser view superview-name superview
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>superview-name</code></td>
<td>Superview name, which can include 1 to 30 alphanumeric characters. The <code>superview-name</code> argument must not have a number as the first character.</td>
</tr>
</tbody>
</table>

### Defaults

A superview does not exist.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3(11)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRB</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRB.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A superview consists of one or more command-line interface (CLI) views, which allow users to define what commands are accepted and what configuration information is visible. Superviews allow a network administrator to easily assign all users within configured CLI views to a superview instead of having to assign multiple CLI views to a group of users.

Superviews contain the following characteristics:

- A CLI view can be shared among multiple superviews.
- Commands cannot be configured for a superview; that is, you must add commands to the CLI view and add that CLI view to the superview.
- Users who are logged into a superview can access all of the commands that are configured for any of the CLI views that are part of the superview.
- Each superview has a password that is used to switch between superviews or from a CLI view to a superview.

**Adding CLI Views to a Superview**

You can add a view to a superview only after a password has been configured for the superview (via the `secret 5` command). Thereafter, issue the `view` command in view configuration mode to add at least one CLI view to the superview.
Before adding a CLI view to a superview, ensure that the CLI views that are added to the superview are valid views in the system; that is, the views have been successfully created via the `parser view` command.

**Examples**

The following sample output from the `show running-config` command shows that “view_one” and “view_two” have been added to superview “su_view1,” and “view_three” and “view_four” have been added to superview “su_view2”:

```
! parser view su_view1 superview
  secret 5 <encoded password>
  view view_one
  view view_two
!
parser view su_view2 superview
  secret 5 <encoded password>
  view view_three
  view view_four
!
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parser view</td>
<td>Creates or changes a CLI view and enters view configuration mode.</td>
</tr>
<tr>
<td>secret 5</td>
<td>Associates a CLI view or a superview with a password.</td>
</tr>
<tr>
<td>view</td>
<td>Adds a normal CLI view to a superview.</td>
</tr>
</tbody>
</table>
To associate a command-line interface (CLI) view or a superview with a password, use the `secret` command in view configuration mode.

```
secret { unencrypted-password | 0 unencrypted-password | 5 encrypted-password }
```

### Syntax Description

- **unencrypted-password**: Nonencrypted password. A password can contain any combination of alphanumeric characters. The password is case sensitive. This clear-text password will be encrypted using the Message Digest 5 (MD5) method.
- **0**: Specifies that an unencrypted password will follow.
- **5**: Specifies that an encrypted password will follow.
- **encrypted-password**: Encrypted password that you enter and that is copied from another router configuration.

### Defaults

User cannot access a CLI view or superview.

### Command Modes

View configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3(14)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A user cannot access any commands within the CLI view or superview until the `secret` command has been issued.

**Note**

The password cannot be removed, but you can overwrite it.

### Examples

The following examples show how to configure two CLI views, “first” and “second,” and associate each view with a password:

**CLI View “first”**

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# parser view first
Router(config-view)#
*Dec 9 05:20:03.039: %PARSER-6-VIEW_CREATED: view 'first' successfully created.
Router(config-view)# secret firstpassword
Router(config-view)# secret secondpassword
% Overwriting existing secret for the current view
Router(config-view)# secret 0 thirdpassword
% Overwriting existing secret for the current view
Router(config-view)# secret 5 $1$fj1e$vmYyRbmj5UqU96tTlx7ePl
% Overwriting existing secret for the current view
```
Router(config-view)# secret 5 invalidpassword
ERROR: The secret you entered is not a valid encrypted secret.
To enter an UNENCRYPTED secret, do not specify type 5 encryption.
When you properly enter an UNENCRYPTED secret, it will be encrypted.

Router(config-view)# command exec include show version
Router(config-view)# command exec include configure terminal
Router(config-view)# command configure include all ip
Router(config-view)# exit

**CLI View “second”**

Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# parser view second
Router(config-view)#
*Dec 30 06:11:52.915: %PARSER-6-VIEW_CREATED: view 'second' successfully created.
Router(config-view)# secret mypasswd
Router(config-view)# commands exec include ping
Router(config-view)# end

Router# show running-config

parser view second
  secret 5 $1$PWs8$1z31Sx6OgAnFrUX2hkI0w0
  commands exec include ping

The following is an example of show running-config output for a situation in which the secret command has been configured using a level 5 encrypted password:

Router: show running-config

parser view first
secret 5 $1$jj1e$vmYyRbmj5UoU96tT1x7eP1
commands configure include all ip
commands exec include configure terminal
commands exec include configure
commands exec include show version
commands exec include show

<table>
<thead>
<tr>

</tbody>
</table>
show parser view

To display command-line interface (CLI) view information, use the `show parser view` command in privileged EXEC mode.

`show parser view [all]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Displays information about all CLI views that are configured on the router.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3(7)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRB</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRB.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show parser view` command will display information only about the view that the user is currently in. This command is available for both root view users and lawful intercept view users—except for the `all` keyword, which is available only to root view users. However, the `all` keyword can be configured by a user in root view to be available for users in lawful intercept view.

The `show parser view` command cannot be excluded from any view.

**Examples**

The following example shows how to display information from the root view and the CLI view “first”:

```
Router# enable view
Router# 01:08:16:%PARSER-6-VIEW_SWITCH:successfully set to view 'root'.
Router# ! Enable the show parser view command from the root view
Router# show parser view
Current view is 'root'
! Enable the show parser view command from the root view to display all views
Router# show parser view all
Views Present in System:
View Name:   first
View Name:   second
! Switch to the CLI view “first.”
Router# enable view first
Router# 01:08:09:%PARSER-6-VIEW_SWITCH:successfully set to view 'first'.
! Enable the show parser view command from the CLI view “first.”
Router# show parser view
Current view is 'first'
```

<td>12.2(33)SRB</td>
<td>The <code>lawful-intercept</code> keyword was integrated into Cisco IOS Release 12.2(33)SRB.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command displays the line number, connection name, idle time, hosts (including virtual access interfaces), and terminal location. An asterisk (*) indicates the current terminal session.

If the `lawful-intercept` keyword is issued, the names of all users who have access to a configured lawful intercept view will be displayed. To access the `show users lawful-intercept` command, you must be an authorized lawful-intercept-view user.

### Examples

The following is sample output from the `show users` command:

```
Router# show users
Line User Host(s) Idle Location
0 con 0 idle
* 2 vty 0 user1 idle 0 SERVICE1.CISCO.COM
```

The following is sample output identifying an active virtual access interface:

```
Router# show users
Line User Host(s) Idle Location
* 0 con 0 idle 01:58
10 vty 0 Virtual-Access2 0 1212321
```
The following is sample output from the `show users all` command:

```plaintext
Router# show users all
Line User Host(s) Idle Location
* 0 vty 0 user1 idle 0 SERVICE1.CISCO.COM
1 vty 1
2 con 0
3 aux 0
4 vty 2
```

Table 2 describes the significant fields shown in the displays.

The following sample output from the `show users lawful intercept` command, shows three LI-View users on the system—li_admin, li-user1, and li-user2”:

```plaintext
Router# show users lawful-intercept
li_admin
li-user1
li-user2
Router#
```

username

To establish a username-based authentication system, use the `username` command in global configuration mode. Use the `no` form of this command to remove an established username-based authentication.

```
username name [nopassword | password password | password encryption-type encrypted-password]
username name password secret
username name [access-class number]
username name [autocommand command]
username name [callback-dialstring telephone-number]
username name [callback-rotary rotary-group-number]
username name [callback-line [tty] line-number [ending-line-number]]
username name dnis
username name [nocallback-verify]
username name [noescape] [nohangup]
username name [privilege level]
username name user-maxlinks number
username [lawful-intercept] name [privilege privilege-level | view view-name] password password
no username name
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Host name, server name, user ID, or command name. The name argument can be only one word. Blank spaces and quotation marks are not allowed.</td>
</tr>
<tr>
<td>nopassword</td>
<td>No password is required for this user to log in. This is usually most useful in combination with the <code>autocommand</code> keyword.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies a possibly encrypted password for this username.</td>
</tr>
<tr>
<td>encryption-type</td>
<td>Single-digit number that defines whether the text immediately following is encrypted, and, if so, what type of encryption is used. Currently defined encryption types are 0, which means that the text immediately following is not encrypted, and 7, which means that the text is encrypted using a Cisco-defined encryption algorithm.</td>
</tr>
<tr>
<td>encrypted-password</td>
<td>Encrypted password a user enters.</td>
</tr>
<tr>
<td>password</td>
<td>Password a user enters.</td>
</tr>
<tr>
<td>password</td>
<td>Password to access the name argument. A password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the <code>username</code> command.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>secret</td>
<td>For CHAP authentication: specifies the secret for the local router or the remote device. The secret is encrypted when it is stored on the local router. The secret can consist of any string of up to 11 ASCII characters. There is no limit to the number of username and password combinations that can be specified, allowing any number of remote devices to be authenticated.</td>
</tr>
<tr>
<td>access-class</td>
<td>(Optional) Specifies an outgoing access list that overrides the access list specified in the access-class line configuration command. It is used for the duration of the user’s session.</td>
</tr>
<tr>
<td>number</td>
<td>(Optional) Access list number.</td>
</tr>
<tr>
<td>automan</td>
<td>(Optional) Causes the specified command to be issued automatically after the user logs in. When the command is complete, the session is terminated. Because the command can be any length and contain embedded spaces, commands using the autocommand keyword must be the last option on the line.</td>
</tr>
<tr>
<td>command</td>
<td>(Optional) The command string. Because the command can be any length and contain embedded spaces, commands using the autocommand keyword must be the last option on the line.</td>
</tr>
<tr>
<td>callback-dialstring</td>
<td>(Optional) For asynchronous callback only: permits you to specify a telephone number to pass to the DCE device.</td>
</tr>
<tr>
<td>telephone-number</td>
<td>(Optional) For asynchronous callback only: telephone number to pass to the DCE device.</td>
</tr>
<tr>
<td>callback-rotary</td>
<td>(Optional) For asynchronous callback only: permits you to specify a rotary group number. The next available line in the rotary group is selected.</td>
</tr>
<tr>
<td>rotary-group-number</td>
<td>(Optional) For asynchronous callback only: integer between 1 and 100 that identifies the group of lines on which you want to enable a specific username for callback.</td>
</tr>
<tr>
<td>callback-line</td>
<td>(Optional) For asynchronous callback only: specific line on which you enable a specific username for callback.</td>
</tr>
<tr>
<td>tty</td>
<td>(Optional) For asynchronous callback only: standard asynchronous line.</td>
</tr>
<tr>
<td>line-number</td>
<td>(Optional) For asynchronous callback only: relative number of the terminal line (or the first line in a contiguous group) on which you want to enable a specific username for callback. Numbering begins with zero.</td>
</tr>
<tr>
<td>ending-line-number</td>
<td>(Optional) Relative number of the last line in a contiguous group on which you want to enable a specific username for callback. If you omit the keyword (such as tty), then line-number and ending-line-number are absolute rather than relative line numbers.</td>
</tr>
<tr>
<td>dnis</td>
<td>Do not require password when obtained via DNIS.</td>
</tr>
<tr>
<td>nocallback-verify</td>
<td>(Optional) Authentication not required for EXEC callback on the specified line.</td>
</tr>
<tr>
<td>noescape</td>
<td>(Optional) Prevents a user from using an escape character on the host to which that user is connected.</td>
</tr>
<tr>
<td>nohangup</td>
<td>(Optional) Prevents Cisco IOS software from disconnecting the user after an automatic command (set up with the autocommand keyword) has completed. Instead, the user gets another EXEC prompt.</td>
</tr>
<tr>
<td>privilege</td>
<td>(Optional) Sets the privilege level for the user.</td>
</tr>
<tr>
<td>level</td>
<td>(Optional) Number between 0 and 15 that specifies the privilege level for the user.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
**Usage Guidelines**

The `username` command provides username or password authentication, or both, for login purposes only.

Multiple `username` commands can be used to specify options for a single user.

Add a username entry for each remote system with which the local router communicates and from which it requires authentication. The remote device must have a username entry for the local router. This entry must have the same password as the local router’s entry for that remote device.

This command can be useful for defining usernames that get special treatment. For example, you can use this command to define an “info” username that does not require a password but connects the user to a general purpose information service.

The `username` command is required as part of the configuration for the Challenge Handshake Authentication Protocol (CHAP). Add a username entry for each remote system from which the local router requires authentication.

---

**Note**

To enable the local router to respond to remote CHAP challenges, one `username name` entry must be the same as the `hostname` entry that has already been assigned to the other router.

---

**Note**

To avoid the situation of a privilege level 1 user entering into a higher privilege level, configure a per-user privilege level other than 1 (for example, 0 or 2 through 15).

---

**Note**

Per-user privilege levels override virtual terminal (VTY) privilege levels.

---

**CLI and Lawful Intercept Views**

Both CLI views and lawful intercept views restrict access to specified commands and configuration information. A lawful intercept view allows a user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of simple network management protocol (SNMP) commands that stores information about calls and users.

Users who are specified via the `lawful-intercept` keyword are placed in the lawful-intercept view, by default, if no other privilege level or view name has been explicitly specified.

If there is no `secret` specified and the `debug serial-interface` command is enabled, an error is displayed when a link is established and the CHAP challenge is not implemented. CHAP debugging information is available using the `debug ppp negotiation`, `debug serial-interface`, and `debug serial-packet` commands. For more information about `debug` commands, refer to the *Cisco IOS Debug Command Reference*.

---

**Examples**

The following example implements a service similar to the UNIX `who` command, which can be entered at the login prompt and lists the current users of the router:

```
username who nopassword nohangup autocommand show users
```

The following example implements an information service that does not require a password to be used. The command takes the following form:

```
username info nopassword noescape autocommand telnet nic.ddn.mil
```
The following example implements an ID that works even if all the TACACS+ servers break. The command takes the following form:

```
username superuser password superpassword
```

The following example enables CHAP on interface serial 0 of “server_1.” It also defines a password for a remote server named “server_r.”

```
hostname server_1
username server_r password theirsystem
interface serial 0
  encapsulation ppp
  ppp authentication chap
```

When you look at your configuration file, the passwords will be encrypted, and the display will look similar to the following:

```
hostname server_1
username server_r password 7 121F0A18
interface serial 0
  encapsulation ppp
  ppp authentication chap
```

In both of the following configuration examples, a privilege level 1 user is denied access to privilege levels higher than 1:

```
username user privilege 0 password 0 cisco
username user 2 privilege 2 password 0 cisco
```

The following example removes the username-based authentication for user 2:

```
no username user 2
```

### Related Commands

<td>Displays information about the active lines on the router.</td>
</tr>
</tbody>
</table>
view

To add a normal command-line interface (CLI) view to a superview, use the `view` command in view configuration mode. To remove a CLI view from a superview, use the `no` form of this command.

```plaintext
view view-name

no view view-name
```

**Syntax Description**

- `view-name` CLI view that is to be added to the given superview.

**Defaults**

A superview will not contain any CLI views until this command is enabled.

**Command Modes**

- View configuration

**Command History**

- **Release** | **Modification**
  - 12.3(11)T | This command was introduced.
  - 12.2(33)SRB | This command was integrated into Cisco IOS Release 12.2(33)SRB.

**Usage Guidelines**

Before you can use this command to add normal views to a superview, ensure that the following steps have been taken:

- A password has been configured for the superview (via the `secret 5` command).
- The normal views that are to be added to the superview are valid views in the system; that is, the views have been successfully created via the `parser view` command.

**Examples**

The following sample output from the `show running-config` command shows that “view_one” and “view_two” have been added to superview “su_view1,” and “view_three” and “view_four” have been added to superview “su_view2”:

```plaintext
! parser view su_view1 superview
  secret 5 <encoded password>
  view view_one
  view view_two
 !
parser view su_view2 superview
  secret 5 <encoded password>
  view view_three
  view view_four
 !
```
