# Remote Site

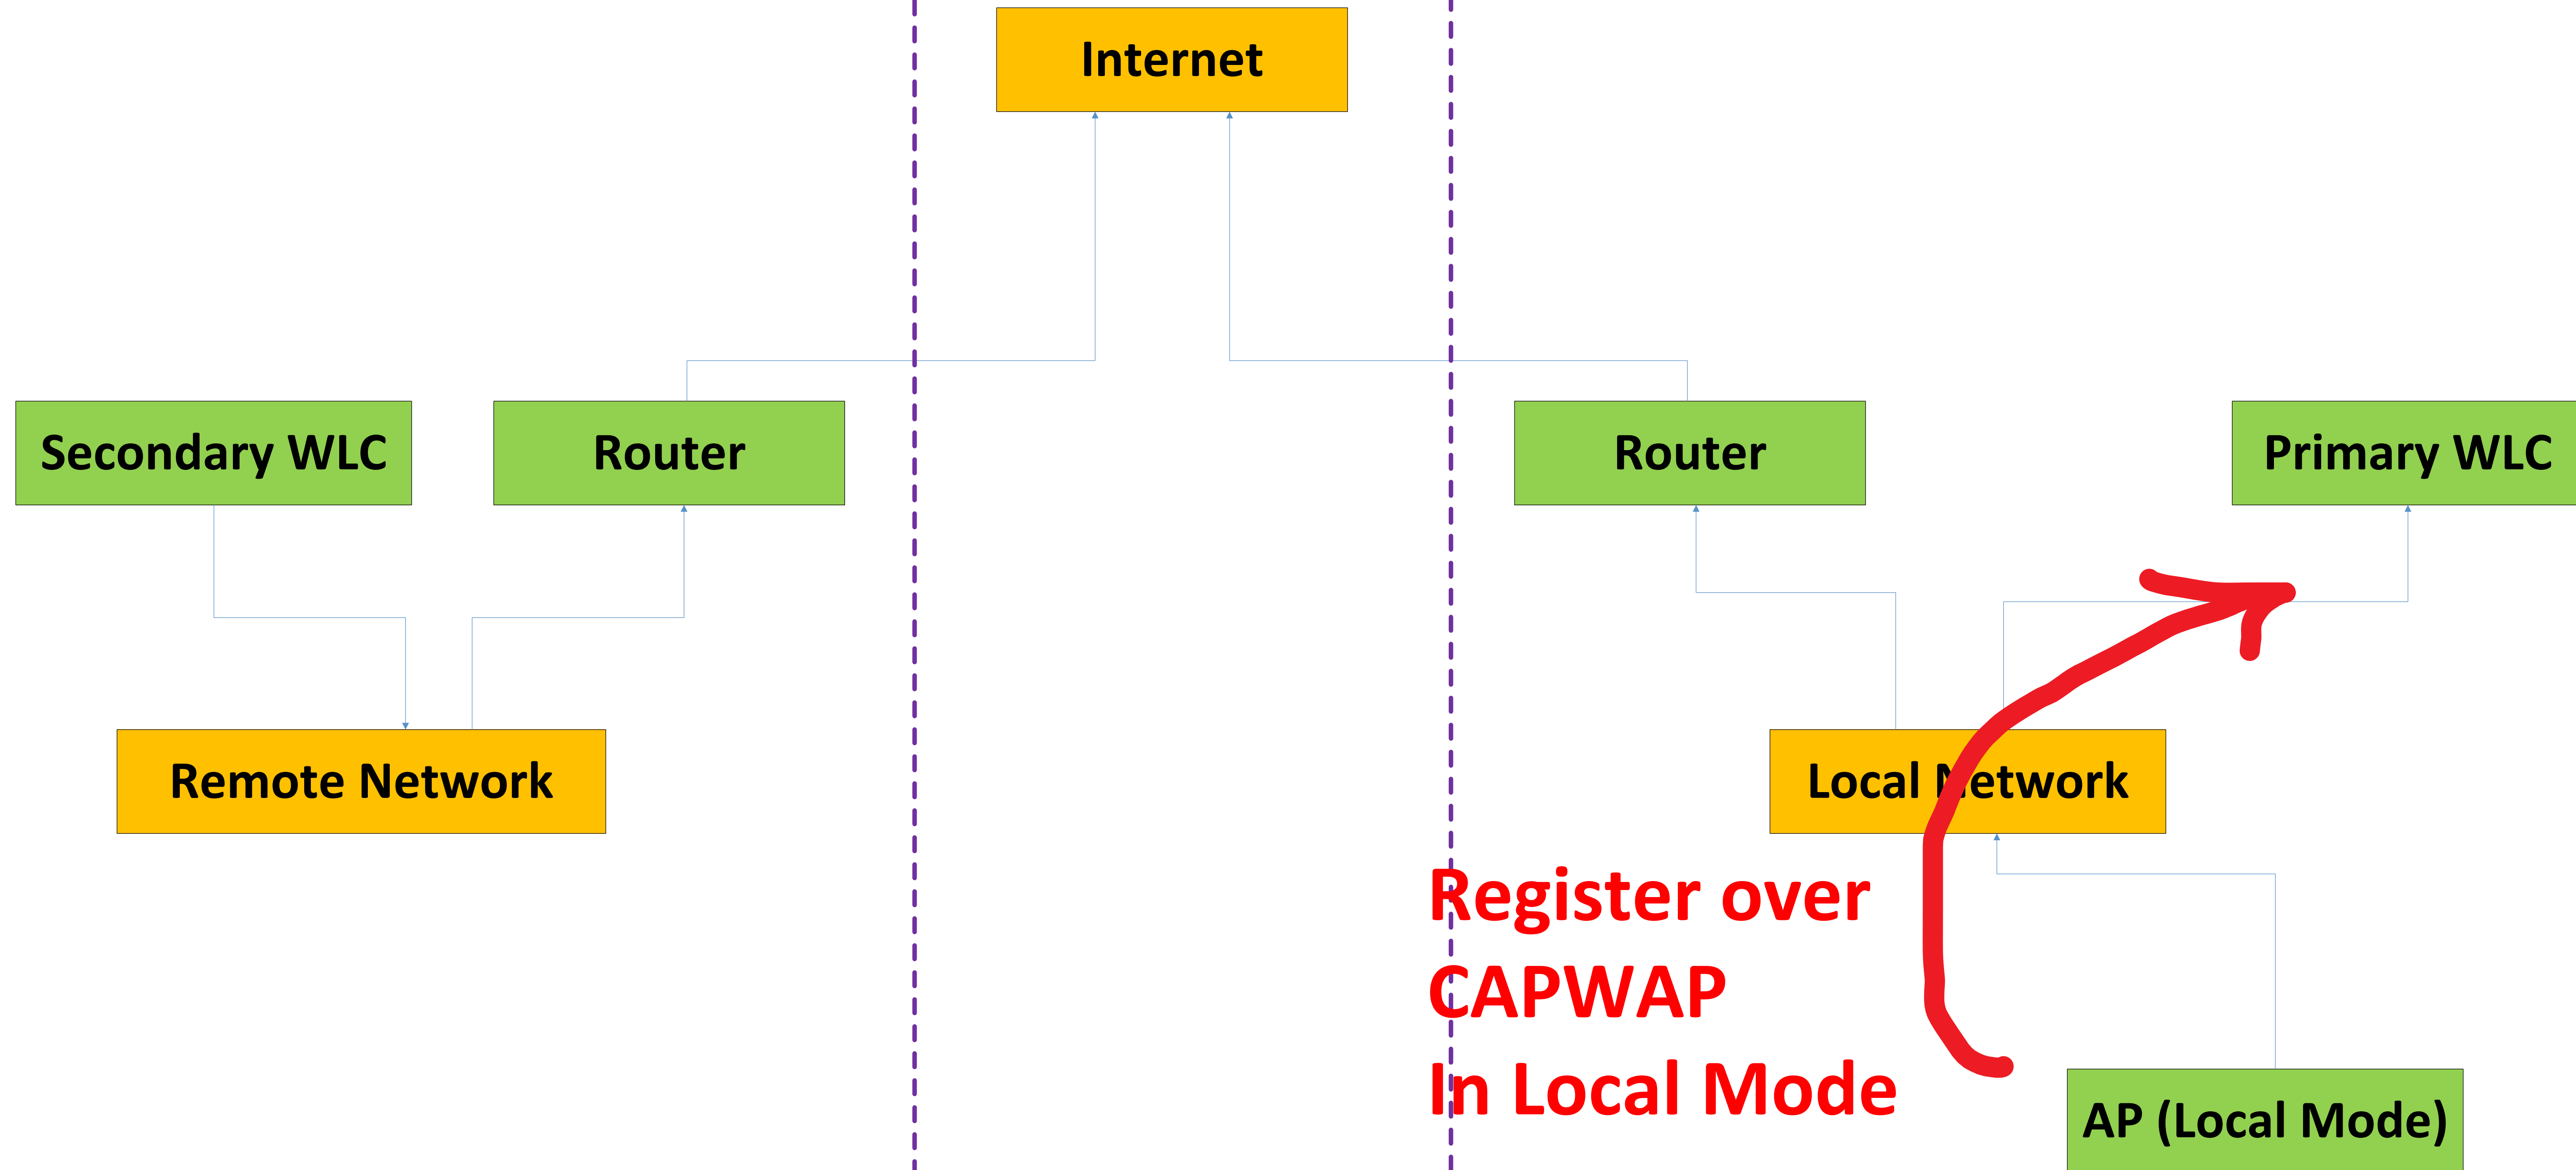

# Local Site

**Register over  
CAPWAP  
In Local Mode**

**Primary WLC  
Failure**

below points to considered:

- 1- Internet link latency should be 100 ms
- 2- IPsec Tunnel should be established between Remote Site and Local Site to access the private IP of the WLC on Remote Site
- 3- WLC in Remote Site will be Secondary WLC while WLC in Local Site will be Primary WLC and their configuration should always be identical and managed by the network administrator.
