**Accessing Documents in Repository with UCCX Config API** Jun 5, 2017 8:46 AM

Hi All,

I'm working with the UCCX Config API, trying to retrieve and update XML Documents from the UCCX Documents Repository. I'm able to get a listing of Documents by recursively parsing through the response of /adminapi/document, but I can't find a way to download an actual Document file... I've tried the /adminapi/document/{FilePath} resource, but that's only returning the details of said resource (filename, path, file size, date modified, etc.). Scripts and prompts have the /adminapi/prompt/**download**/{FilePath} resource, which Documents don't seem to have.

Can anyone shed any light on this?

Thanks!

~ Eric

Hi Eric,

Currently only scripts and prompts files can be downloaded using AdminAPI.  
There is no AdminAPI available to download document files.

Regards,

Jyothish Joshi

Thanks for your reply, Jyothish!

Would you or anyone else know whether this is coming in a future UCCX release?

API access to the Documents repository can be extremely helpful for managing XML Documents for Hours of Operations, Holidays, etc.

Thanks.

~ Eric

You could create an HTTP trigger to access the documents in question and create your own "API" for your app.

Indeed, jsanders, we're already doing this today.

However, I find this solution quite kludgy and a proper API (such as the ones already available today for accessing Prompts and Scripts) would be great for simplifying accessing Documents in the repository.

Thanks!

~ Eric
