Introduction

This document provides information about hotfix #5 for Tidal Enterprise Orchestrator version 2.1.2.

Prerequisites

Components Used

The information in this document is based on the Tidal Enterprise Orchestrator version 2.1.2.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Issue

SQL Activities fail when the SQL query contains an empty string expression as the left side operand in a WHERE clause; for example, "select * from SampleTable where " = " ". In addition, these four activities timeouts were fixed:

- Execute DB2 SQL Script
- Execute Generic Database SQL Script
- Execute Oracle SQL Script
- Execute SQL Server SQL Script

TEO 2.1.2 HotFix 5

HotFix 5 can fix the above listed issues. Any release after the above version will include this hotfix and therefore is not required to be patched. Open a case and contact support in order to get access to this and any other Tidal Enterprise Orchestrator HotFix.
